disadvantages.

>
>Monotasking:
> You write some source with the editor, leave the editor, compile,
> debug, find an error and start the editor again. Each application
> has to be left before the next can run.

Plus, each application runs at the full speed of the processor without
being interrupted every now and then so that the scheduler can start
up to "direct traffic". Thus, in its simplicity, a single-tasking
system avoids the typical 10-40% overhead on the processor due to the
kernel having to do its housekeeping (e.g. basically "asking" each
process "Do you want to run now?"). An 8MHz single-tasking machine
running a given program would appear to be a 7.2 MHz machine if it had
multitasking overhead of only 10%.

Since a lot of the time a single-user machine like the ST only needs
to be running one program, there'd better be a good reason to penalize
the user with a significant amount of overhead all the time.

Once two processes start running at the same time, each process will
seem slower because they are sharing the processor time with each other
and the scheduler; each process will then be running at 50% speed
(minus the speed of the overhead). If one of them stops to wait for

the disk, say, then the other usually gains back the entire processor minus the overhead (minus any slowdown due to the disk transfer and the processor trying to use memory at the same time).

Run too many other processes, and the machine may become unusably slow. The user might be frustrated to press a key and not get the expected response (yet). He might start to think that the machine is hung. To get around this, some schedulers pre-empt the processor so that that the user is still able to type, use the mouse...at nearly the speed he is accustomed (at the expense of other processes). But this adds even more code to the scheduler which you are trying to keep small because of overhead.

In addition, if there is neither multitasking nor task switching, each application has the entire memory space to itself, so it will not crash due to some other processes having tweaked its memory space (sometimes by accident, sometimes by ignorance...sometimes on purpose];-D).

>
>Multitasking:
> Load all applications before use, and switch (without loading)
> only to the one you wanna use. Indeed this is faster !
>
What you've described is only task-switching. When you type control-Z from Gulam's built-in 'ue' editor to go back to the shell, or type fg to go back in, you are task-switching. You are also task switching if you are in Gulam's terminal emulator and press the Undo key to go back to the shell screen. Indeed this is fast. But Multitasking is having many processes loaded AND (potentially) running at the same time. It means that two processes that don't know what each other does can possibly be using the other's memory without its permission.

I don't mean to imply that because a machine is multitasking it will always be crashing. In fact, I prefer being able to start it up, if only because I like to keep editing while I'm compiling a large program. But on a machine with no MMU, it is necessarily risky.

Say you had ten processes running at the same time. The risk is ten times higher that some of the code in RAM will have a bug in it or will misbehave. You have to be doubly careful if you are doing serious work, and at the same time you are starting up a new program that you haven't used before. So you save your files and wait for the save to finish before you try the experimental stuff.

To be even more sure that the new program hasn't smashed a part of the data in the other programs, you quit the other programs. You don't want part of the program you're writing to have a bunch of funny characters in it all of a sudden. And to be safe from having the operating system's tables (which it has to have in RAM to multitask) tweaked by the program, providing wierd behaviour later, you quit the operating system. Yes, you can do

this with MiNT (and possibly Beckemeyer's MT C-shell) on the ST,
by exiting the top-level shell.

there is also a 4096 color palette, and I think it has RCA jacks (ports?)
for the stereo audio, and the ability to add more memory with SIMM's.

> help.

I'm sorry, but all versions of GEMINI require TOS > 1.0 because they use some
vectors which don't exist in this first version of TOS.

But there is consolation for you: The applications MUPFEL.APP and VENUS.APP
are part of the GEMINI distribution and they will run on TOS 1.0, too.
If you take both of them, you can enjoy nearly the same comfort as you get
while using GEMINI.

Does anyone know if these two compilers have any kind of support for DRI link format? I know it's not a great format but it's native to Alcyon C and Sozobon C, imported by Laser C and converted by Mark Williams C. If there is no support for it currently, will ther be in the future?

I know that one of the problems with link format support is the calling conventions used. DRI stacks the parameters and use words or longwords. Un*x style would stack only longs and passing paramters in registers would also increase speed. Perhaps these optins are selectable.

Gee Kevin,
I don't where you got your information about a TT not being displayed at the NAMM show, but it is wrong. I was one of Atari's volunteers that setup the booth at the NAMM show and the TT was setup on a counter where the public could get thier hands on it. Atari did display the TT at the NAMM show. Just thought you should know. Bye.............

****

Atari News:By Chuck Schul

Atari Corp-

They Released a new color monitor(colour for your brits out there) the SC1435 with 2 stereo speakers and will take advantage of the STE's 8 bit digital; stereo.

Goldleaf Publishing-

They are offering a trade in on other wordproccessors,for $75 and your master disk of either microsoft write,first word plus,word up,or wordwriter ST you will get wordflair II package. Contact them at 415-461-5703

Readysoft Inc.-

They have released Dragon's lair II :Time warp.Call 416-731-4175 for more details.

8 Bit Cave:By Chuck Schul

Well still no one to help write this section but I have read of some new products that will help out some of you 8 bit people:

1-Diamond paint:

Neat paint program that allows you to cut and save pieces of your pics.Requires the diamond cart(which is a operating system like the ST)

Contact Reeve Software 312-393-2317.Price 79.95

2-Express:

A telecomminication program on a cart for the 8 bit to take of advantage of the XEP80 card.Price 69.95

Contact Orion micro Systems 804-794-9437.

3-Daisy Dot III:

For $25 bucks you can get letter quality printing from your 9 pin using this program which is shareware.Creates letter quality print in several type of fonts styles even if your printer does not support letter quality fonts.

Contact Roy Goldman,2440 s.jasmine st. denver Co 80222 req 48k dos 2.5 or Sparta dos.$25 dollars.

Thats all I got for now,see ya next time.

ST Hovel: By Chuck Schul

Being new to the St world is not easy.Trying to understand your old and new-Ways and limits are hard.Since most magazines and software boxes not all I see

Don't have memory requiements on the box.I always got to ask the dealer or mailorder guys(who are lost at times,I wonder if i am talking to myself at -times)400k disk which are not protected can be trannsfered to 800k.But the protected ones I can't put two on a disk.I have heard of programs which do this.But I have yet to track it down.Anybody know anynames spit it out now!

I wish these things would be clearer,I guess some people don't care.

Public Domain Of the Month:

Megablit-

Great paint program that runs on all Graphic modes 512k on up.Compatble with

deagas format so easy to use you might never use anything else.

Atari BBS List:

Solano Station BBS-707-446-4158

A nice friendly bbs,good stock of stuff.

Oddessey BBS-707-437-4734

A good well rounded board with programs for all computer types.

Starlink BBS-707-437-3468

Large Atari bbs,with files for other types also.Good online games.

Reviews:By Ed Krimen.

From: ekrimen@ecst.csuchico.edu (Ed Krimen)

Subject: MegaSTe info

Here's some info on the MegaSTe from Gregory (carter@garfield.cs.wisc.edu).

For those of you who are curious about the new and rather hard to

find Mega STe in the US, here are some performance figures:

Quick Index 1.8

Tos 1.0 Tos 1.4 Tos 1.6

Cpu Memory 165% ---- -----

Reg 205% ---- -----

Divide 204% ---- -----

Shifts 208% 207% -----

Dma 64K Read 5680% ----- -----

Gemdos Files 1583% 1607% -----

Disk RPM 2408 ----- -----

TOS text 121%/536%(Turbo) 386%(Turbo) 342%(Turbo)

string 118%/1911%(Turbo) 1288%(Turbo) 1181%(Turbo)

scroll 181%/195%(Turbo) 140%(Turbo) 110%(Turbo)

GEM Dialog 209%/460%(Turbo) 437%(Turbo) 276%(Turbo)

The MEGA STe is really an awesome machine. Its very fast, Atari has mightily improved the hard disk controller, I get three times the thruput than on my old SH204, and the drive itself that came with it is a 157N, a very nice 50 megabyte hard drive.

Through the VME slot on the back, I popped out the card, and looked inside too see SIMM's, a nice 90 WATT power supply, and a vacant 68881 socket.

I noticed too, that the, (cannoy confirm have to rip the whole machine a part which I may do this weekend), but the floppy drive looks like a 1.4 megabyte drive, sony mechanism. The floppy drive controller chip is socketed so even though its a WD 1772, it may be easily removed in the future for a better flopyy controller.

I am a US developer, so I got mine under the wire, ONE LEFT. In fact, there were only 10 MACHINE shipped to thr US, by developer request. The rest went to the European and Canadian community. You cannot not NOBODY CAN get one in the US. If some guy tries to con you, wait till around April/May, when they should be made available in the US.

The Spectre GCR works very nice with this machine. You get hard disk performance of something between a IIfx and IIsi. 600-700 kiloBYTES per second. 33ms access time.

Kitty Corner:These are the only known Lynx games to date:

1-electrocop 2-blue lightning 3- chips challenge 4-zarlor mercenary

5-klax 6-xenophobe 7-slime world 8-paperboy

9-roadblaster 10-ms pac man 11-guantlet 12-gates of zndocan

13-robo squash 14-rampage

coming soon:shanghi

Last Notes-

Well it is sad to hear that ST Jornal has stopped publication temporarly of there magazine.I keep on hearing these magazines stopping and restarting it seems like a trend hopefully for the good.Now Huh will be

published monthly due to lack of help .If I get help we will go bi-weekly.We

will also publish an extra issue with late breaking news as warranted.Until

next time I hope to hear from you all soon.

From: csuab@warwick.ac.uk
Message-ID: <1991Feb14.122613.15289@warwick.ac.uk>
Source record: 234401

Hi There,

I'm in the market for a hard drive, and need some advice on the best types. I've been through the things I've used and decided that I need about 50meg, although I could probably get away with 40 if it was a good price. If you could give me you opinions on the ones you have used, I would be most grateful. Details such as speed, reliability and price are most important, price being the main one! If you are posting from outside of the U.K., price will probably not be that useful, unless the company concerned ships abroad. Replies by email please, if anyone else is interested in the results, I will be happy to forward them.

Thanks Alot

Steve

Recently Bob Bright talked about BITFTP. Well, I post a copy the Help-file,
but until know I don't have any experience with it.
Maybe any other can try it.

Ralf

Ralf Gaertner e-mail: gaertner@venus.rz-berlin.mpg.de
FHI Berlin

BITFTP -- Princeton BITNET FTP Server

(bitftp@pucc.nitnet)

BITFTP provides a mail interface to the FTP portion of the IBM
TCP/IP product ("FAL") running on the Princeton VM system, to allow
BITNET/NetNorth/EARN users to ftp files from sites on the Internet.

To use BITFTP, send mail containing your ftp commands to BITFTP@PUCC
(or to BITFTP@PUCC.Princeton.edu).

The first command to BITFTP must be "FTP", "FTPLIST", "HELP", or
"VMS". If you send BITFTP mail or a message containing only the
command "FTPLIST", it will send you a list of some of the hosts that
allow anonymous ftp. (Note that there is no guarantee that BITFTP
can access all the hosts in that list.) Use "HELP" to request a
current copy of this help file. Use "VMS" to request a collection
of tips provided by BITFTP users on how to handle binary files from
BITFTP on VMS systems.

The recommended syntax for FTP requests is:

FTP hostname NETDATA --or-- FTP hostname UUENCODE
USER username password

QUIT

Following the hostname on the FTP command, you may specify
"UUENCODE" or "NETDATA" to tell BITFTP the format in which you wish
to receive files.

If the username is "anonymous", no password is required; BITFTP will
use your userid and nodeid as the password. Note that on many
systems passwords are case-sensitive; that is, the password may be
required to be in lower case or mixed case or upper case. (The same
is true of directory and file names.)

The following is an example of an ftp request:

```
FTP f.ms.uky.edu NETDATA
USER anonymous
CD /pub/msdos/Games
DIR
BINARY
GET robotron.arc msdos.robotron
QUIT
```

BITFTP implements a subset of the ftp subcommands provided in the IBM TCP/IP and uses the same syntax. Therefore, you may find it useful to obtain the "IBM TCP/IP for VM Command Reference Manual", IBM order number GC09-1204.

The currently supported subcommands are:

ACCT -- to send host-dependent account information.
format: ACCT account-information

ASCII -- to change the file transfer type to ASCII.
format: ASCII

BINARY -- to change the file transfer type to image.
format: BINARY

CD -- to change the working directory.
format: CD directory

CLOSE -- to disconnect from the foreign host.
format: CLOSE

DIR -- to get a list of directory entries.
format: DIR

EBCDIC -- to change the file transfer type to EBCDIC
format: EBCDIC

GET -- to get a file from the foreign host.
format: GET foreignfile

If you specify "localfile", it must be in
the forms "filename.filetype" or "filename",
and the filename and filetype may each be no
more than 8 characters long and may not contain
periods.

LOCSTAT -- to display local status information.
format: LOCSTAT

LS -- to list the files in a directory.
format: LS

PWD -- to print the working directory.
format: PWD

QUIT -- to disconnect from the foreign host.
format: QUIT

STATUS -- to retrieve status information from a foreign host.
format: STATUS

SYSTEM -- to get the name of the foreign host's operating
system.
format: SYSTEM

TYPE -- to specify Image, ASCII, or EBCDIC file transfer.
format: TYPE

BITFTP does not provide a PUT capability, and there is no intention to make it do so in the future.

BITFTP currently accepts requests only via RFC822-format mail, IBM NOTE-format mail, PROFS-format messages, or files with no headers at all. BITFTP currently returns the requested files as NETDATA-format files or as mail files containing UUENCODED data. If you specify "UUENCODE" or "NETDATA" on your "FTP" command, BITFTP will attempt to use that format. If you do not specify the format, BITFTP will attempt to select the appropriate format for your node.

UUENCODED files are broken up into mail files that contain no more than 50,000 bytes of data. NETDATA-format files that are larger than 300,000 bytes are sent in 300,000-byte pieces using the BITSEND function. You should be able to receive such files using the BITRCV function available from your nearest NETSERV. (If you do not know how to use NETSERV, ask your local BITNET/EARN/NetNorth Coordinator for assistance.) If BITRCV is not available for your system, use the command you normally use to receive NETDATA-format files and then concatenate the files in the order shown in the BITRCV control file to recover the original file.

Users in the UK should note that BITFTP attempts to send NETDATA-format files through the gateway from EARN into Janet via the NIFTP facility at Rutherford Lab. Note that receiving files via NIFTP requires an overt action on your part. If you are at a Janet node and don't know how to use NIFTP, you should ask for assistance locally. Alternatively, you can ask BITFTP to send your files UUENCODED inside mail by specifying the "UUENCODE" option.

If BITFTP sends you a file you cannot read, THE FIRST THING TO DO is to make sure that you specified ASCII if the file should contain textual material or that you specified BINARY if the file should contain binary data, executable programs, tar files, or the like. VMS users should specify BINARY F 512 and should use RECEIVE/BINARY to receive the NETDATA-format binary files BITFTP sends them.

If BITFTP sends you a uuencoded file that you cannot uudecode, the first thing to do is to translate all occurrences of 0x7E in the file to 0x5E and then try uudecoding again. (Some gateways are changing 5Es to 7Es when the files pass through them.)

There are many different flavors of UUENCODE/UUDECODE. The version that BITFTP uses puts a "guard character" at the end of each encoded line. Most implementations of uudecode know to ignore this character. If yours does not, then you should remove the last character of each line before attempting to uudecode the file. Note that the guard character is not always "M"; the short lines at the end of the file may have some other guard character, rather than "M". Whatever that character is, it should be removed (or your uudecode should be fixed).

When BITFTP is told to transfer a file in FIXED format, such as "BINARY FIXED 128", it will create a file whose total byte count is an integral multiple of the record length (128, in this case). This means that the last record may be padded to get it to the specified record length. In such a case, you may need to use an editor to shorten the last record so that the total byte count in the file is correct. (If the file is uuencoded when you receive it, shorten it AFTER you have uudecoded it.)

In addition to any files you request, you will also receive a mail file containing a log of your ftp session. In that mail file, entries prefixed by ">" are your original commands; those prefixed by ">>" are your commands as interpreted by BITFTP and passed to TCPIP; those prefixed by ">>>" are your commands as interpreted by TCPIP and passed to the remote host; those prefixed by "<<<" are messages from the remote host; and those prefixed by ">>>>" are completion messages from BITFTP.

If BITFTP is unable to connect to the host you specify, it will send you mail after the first attempt, but will keep trying at intervals over three days. The only additional mail file you will receive will be when the connection is made successfully or when BITFTP gives up after three days.

The load on BITFTP is often very heavy, and network backlogs are often so great that it may take several days for a file to get to you once BITFTP sends it, so please be patient and don't send multiple requests for the same file. If your system allows you to send interactive messages, you can inquire about BITFTP's backlog by sending the query "How are you?", e.g., on a VM system:

TELL BITFTP AT PUCC How are you?

Questions about BITFTP and suggestions for improvements should be directed to Melinda Varian, MAINT@PUCC on BITNET or maint@pucc.princeton.edu on the Internet.

The author gratefully acknowledges the use of the FTP SUBCOM interface written by David Nessl, the SENDJANI EXEC written by Alan Flavell, the uuencoding utility written by John Fisher, and the RFC822 parsing routine written by Eric Thomas. NOTE: If you have any complaints or suggestions about the way any of these routines work in BITFTP, please send them to MAINT@PUCC (Melinda Varian), not

to the authors.

>to be running one program, there'd better be a good reason to penalize
>the user with a significant amount of overhead all the time.

It's not as bad as you make it out to be. First of all, all of the
interrupts (mouse handler, etc.) in the ST can slow down any program
as much as or more than a multi-tasking scheduler. The ideal way to
multi-task is to have the foreground program at full priority, and the
background program(s) at low priority. ie. if you are writing something
in an editor, the editor does not wasted CPU time while it is waiting
for a keystroke, and the compilation process in the background can use
the full CPU. As soon as you hit a key, the editor takes over most or
all of the CPU, and the compilation process bides its time until the
editor is waiting for another keystroke. I'm a fast typist, and I
don't find microemacs sluggish, even when virmf is making a new TeX
font in the background! If you have a slow hard disk, however, any
disk-bound process can slow down all the tasks. However, when I am
running only a single task under MT C-Shell or MiNT, I cannot notice
any speed difference between that and TOS.

1657. Re: DM1: Poison Trap

Newsgroup: comp.sys.atari.st
Date: 1991-02-14 13:52:36 UTC
From: philip@hubcap.clemson.edu
Message-ID: <13110@hubcap.clemson.edu>
Source record: 234542
Cross-posted to: rec.games.misc,comp.sys.amiga.games,comp.sys.atari.st

Gee, my solution was just to run like hell. The first time I tried it, I had someone die, but then I counted steps so I wouldn't waste any moves and just hoofed it. Noone died, but I did need quite a bit of healing. The worst part is the door out closes when the traps go off and you have to stop and open it on the way out. And of course, you can't open it with the sword in your hand, so you have to set it down first.

1658. New Uploads to Atari.archive.umich.edu

Newsgroup: comp.sys.atari.st
Date: 1991-02-14 14:22:55 UTC
From: art@maccs.dcss.mcmaster.ca
Message-ID: <27BA9D40.4702@maccs.dcss.mcmaster.ca>
Source record: 234362

Hi, I just uploaded:
sozobon1.zoo : latest (?) binaries
sozobon2.zoo : latest (?) source
sozoinit.zoo : for acc's & related
sozosun.zoo : instructions & diff's for making a sozobon
cross compiler on a sun

I recently ftp'ed all these files from 'archive.cs.ruu.nl' in
the Netherlands.

In a recent comp.sys.atari.st posting, piet@cs.ruu.nl (Piet van Oostrum)
claimed to have the latest sozobon stuff on his archive. Since the
sozobon at atari.archive.umich.edu dated from October 1988, I thought
I'd ftp the latest from there into North America.

NOTE: originally, sozobon1 & sozobon2 were one file (sozobon.zoo)
which I split into two, because at 1/2 a meg I found it to be rather
big.

FURTHER NOTE: sozosun appears to be for an older version of sozobon, the
diffs will not patch to this source code. Perhaps the original author
of sozosun (Kent.Dalton@FtCollins.NCR.com) would care to take a swing
at upgrading them.

AND ONE LAST NOTE: Jeff informed me that he has moved the old sozobon
stuff to a directory called 'oldsozobon' on atari.archive.umich.edu
so that it is still available if you want it.

regards,

1659. Spectre utilities on atari.archive.umich.edu...

Newsgroup: comp.sys.atari.st
Date: 1991-02-14 15:35:27 UTC
From: ttonino@bio.vu.nl
Message-ID: <1991Feb14.153527.5739@bio.vu.nl>
Source record: 234545

Hello folks, I just mailed some wonderful shareware Spectre
utilities to atari.archive.umich.edu.

These are:

Aladconv: Convert Aladin disks to Spectre
MacExch: Format Spectre disks that can be used on a HD mac drive.
This program is the real beauty of package.
Startup.ps: Print PostScipt files from the Mac on Ultrascript, even
the difficult ones from Freehand etc.

Every Spectre user who has either Ultrascript, Aladin disks or knows
someone with a Macintosh with an FDHD drive. For those, it obviates
the need for a GCR because file exchange is easy and straightforward
on 720 MFM Macintosh- and Atari compatible disks (does not need
Apple file exchange (r) or stuffit!).

Even easier: take the sword, turn around, then throw it as far as you can.
Stay where you are and let the first cloud of poison do its thing. Heal
everybody, then go get the sword and do it again. It appears that the
sword alone won't trigger the poison gas vents, nor will a swordless troupe.

>Your accusations have caused a lot of grief for Kaiser and DEC, and your
>waffling about whether to accept their explanations is rubbing salt in a
>wound that seems to have suffered enough.

I accept Brian Reid's technical explanation without question. The only thing I had my doubts about was Herr Kaiser's complete innocence. I am not of the opinion that the technical difficulties excuse all of his actions. However, my remaining doubts about Herr Kaiser are not worth pursuing.

Besides, if you want to talk about rubbing salt in old wounds, why did you post this after I told you that Hans and I have worked out our differences?

>My conclusion is that Herr Kaiser did not act with malice, and that he
>was not even overly negligent (a real guru might have avoided the problem,
>but it does not appear to be a really slovenly mistake).

So you're saying that it takes a guru to figure out that if you don't get a response from the first 45 messages, you probably won't get a response from the next 45? Now reconcile that with the posted archive limit of 5 requests per day.

>Right now the problem is overly strict system administration at your end.

Not at all, we are a guest on that machine. We can use it as long as we don't cause trouble. People use that machine to get work done. The archive is just a public service, the University doesn't even support Atari machines. (major m*c site)

Anyway, things are looking better in this regard as well. It appears that the sys-admin's intention is to keep us down until we can come up with a technical solution to the basic problem that's at the heart of the matter: a weak quota system. The difficulty is that coming up with a bullet-proof quota system is an insoluable problem at present. The trick is convincing the sys-admin to let us go back up with a partial solution. I think I can swing that, he's a reasonable guy.

From: dhawk@well.sf.ca.us
Message-ID: <23147@well.sf.ca.us>
Source record: 234546

I reviewed WordFlair fairly recently and they just came out with WordFlair II. All my info is at home, so this is just my general impression: WordFlair is very good for short, complex documents. If you need the math/built-in-database features, then it's also a must.

Personally what I tend to type are very long, and very simple documents, so my preference is WordUp, with WordPerfect being a very close second.

Here's a little info on WordFlair II: Added features include a spelling checker and a thesaurus. The graphics handling is faster and the interface has been improved. The database functions are now more powerful. For more information on Wordflair, contact Goldleaf Publishing,700 Larkspur Landing Circle, Suite 199, Larkspur, CA, 94939, (415)381-7717.

There aren't any. In fact, I'm quite surprised Atari would be shipping
something so new - it has been vaporware for so long, the first actual
shipments of a real box running SVR4 were only a few months ago, as I recall.
You must have been confusing "UNIX V.4" with something else.

-
-
-
- Here's some info on the MegaSTe from Gregory (carter@garfield.cs.wisc.edu).

Gregory Carter should get the full credit for this MegaSTe info, not me; I just posted it, not gathered it! I don't think my name should even be in the by-line.

Also, I see that a message of mine was posted in ZNET9105. Am I at least entitled to be notified of this before it gets distributed? Guess not. If I let my fingers do the talking as much as I do on this net, I suppose it's up for grabs without the need for a confirmation from the author that it's all right to print it. It's just kind of surprising to see one of my messages in a worldwide on-line magazine and I didn't even know about it before it was distributed.

We've got a visitor from Meudon, France who likes the
French style keyboard. His word processor does key remapping
and definition of accents etc. so that is OK. However, I was
wondering if there was a program (PD or otherwise) that could
do the keyboard redefinition out of the auto folder.
Any pointers in the direction of a solution would be
greatly appreciated. It may be of interest to others too.

Thanks in advance. Henry

1676. FRO SALE: Atari System $550.00

Newsgroup: comp.sys.atari.st
Date: 1991-02-14 19:57:05 UTC
From: wgg@hp-lsd.COS.HP.COM
Message-ID: <7460007@hp-lsd.COS.HP.COM>
Source record: 234419

The following items for sale:

Atari 520STfm - 1040 mother board, 1Meg memory, 720K DS/DD internal floppy.
It's a 1040 in all ways except the name plate. This is only 1 year old
and in excellent shape.

Atari Monochrome Monitor

Taxan RGB Monitor

Monitor Master - connects both monitiors to the Atari, switch selects between
them.

I have had very good service from this system, with no problems.

I want to sell the above as a complete package for $550.00. However if I
get offers for all of the components I will sell it separately.

>Thus TOS will access disk like devices as letters C thru P.

Thanks, Howard. I would like to add that
there is another limit: the size of each partition.
On early systems, 16 Megabytes per partition.

1678. Info about DELTA MODUL, upon many requests...

Newsgroup: comp.sys.atari.st
Date: 1991-02-14 21:15:31 UTC
From: s37837k@saha.hut.fi
Message-ID: <1991Feb14.211531.1675@santra.uucp>
Source record: 234424

So many requests... So, here is the info for all of you:

(the original is in german, not a strong language for me...)

DELTA MODUL
386SX AT-Emulator & 16MHz 68000 accelerator.

Both processors run 16MHz, both have 16kb cache. There is a socket for
both 80387SX and 68881 math co-processors.
In ST-mode acceleration is about 70-100%.
MS-DOS programs are started from GEM-desktop.
Easy switching between MS-DOS and GEM/TOS.
Can have max. 3 AT-cards, for example a VGA (or super-VGA) -card can be used
under both GEM and MS-DOS! (cheap graphic-extension...)
Speed under MS-DOS Norton factor 15.8.
It is a board that replaces the old 68000, measures are 12.7cm x 14.0cm.
Emulates CGA, Hercules and VGA-monochrome directly.
Works with Autoswitch-Overscan.
Understands all centronics-connected printers.
Does not directly support Atari Laser SLM 804 or SLM 605, laser printouts
have to be made in ST-mode.
Recognices COM1, being the RS232-port, COM2, being the MIDI-interface, and
COM3 being the ST's mouse.
Caches can be switched on and off.
Fully supports Atari hard-disks.
Fully supports HD-floppydrives.
Perfect AT-compatibility, can for example run Windows 3 in extended mode.

Prices:
DM001 Delta Modul 1198,- DM

S1001 AT-slot for 1 card 69,- DM
S3001 AT-slot for 3 cards 119,- DM
F6881 FPU 68881 Motorola 16MHz 295,- DM
F387X FPU 80387SX Intel 16MHz 570,- DM
EDM01 Installation & testing 165,- DM

Where:
OMEGA Computer Systeme GmbH
Oeltzenstr. 14
D-3000 Hannover 1
Germany

Tel. int. +49 (0)511 17294
+49 (0)511 13635
Fax int. +49 (0)511 18289

(leave the zero out when calling outside Germany)

For more detailed info (if I can give it) email me...

Again, not connected to Omega anyhow, except maybe being a future customer...

>not very good since the IBM cset is not supported.

I have found that the VT-100 mode in ST-Talk Pro works very
well. I use it about 3-4 hours/day to communicate with my
universitie's mainframe. It supports underlining and boldface codes
to the screen, has X/Y/Zmodem support (no Kermit), is able to run
'batch' files written in it's own pseudo-basic code, is able to retain
thirty macros, and has a very unusual ability to mimic a user's
keypresses down to the second; after selecting a 'autolog' feature on
a menu, the program records a user's keypresses and writes the
pseudo-basic code to one of ten memory buffers so the user can alter
and run the code, thus mimicking their actions. It also has a
full-fledged editor that can be accessed by pressing the left button
on the mouse.

The only complaint that I have about ST-talk is that it can't
do background downloading, and when I switch from
telecommunications-mode to editor-mode, the program doesn't accept the
VT codes (52 or 100) properly when returning to telecommunications
mode. I tend to stay away from using the editor when doing long
programmin sessions as I can't use EMACS (or other editors) very well
on my mainframe after switching to the editor.

>
> Luis

Thanks for re-informing me..
I got my information from reading the article
in last months ST INFORMER...

Now i have lost a little faith in that paper..
of course, i may have misread it..

QUOTING: ST Informer- February 1991 Number 44
" I was quite surprised by the way
Atari promoted the new top-of-the-line
computer, the TT030....[stuff ommited]..
This year, Atari brought ONE TT030 and
stuck it in a room inthe exhibit accessible
only by appointment to enter the room
and actually use the TT, but we were able
to stand outside the window and watch it
run graphics demos."
-by Jerry and John Davis

Guess it's back to remedial reading for me!

Anyway:
Tell me.. what music software was running on the
TT? any good scoring packages?

There's a sizeable portion of musicians who are
are anxiously waiting for a DTP music package
that takes advantage of the processing speed and
resolution of the TT.

Thanks..

kevin

1681. Directory compress routine - again

Newsgroup: comp.sys.atari.st
Date: 1991-02-14 21:37:58 UTC
From: geoffc@zebedee.uucp
Message-ID: <2417174@zebedee.uucp>
Source record: 234316

I think that my prior posting for a request for a directory compress routine
got a bit misunderstood ! This is what I was hoping for:

If you create a whole load of files (say 200 news articles !) in a directory:

1 2 3 4 5 6 7 8 200

^ (this supposed to represent the directory entries)

and then expire a lot of them you will be left with a directory like this:

x x x x x x x x .... x x x 100 101 102 200

- a whole load of empty directory entries and the other files at the end
of the directory. Reading any of these files takes quite some time for GEM
to read through the directory, check that the file exists and then start
reading the file. This has been quite noticable for me that with lots of
news articles in a directory rn slows down quite considerably as you progress
through the newsgroup. Of course, putting some more files in the directory
puts them in the empty spaces (I think) so you end up with something like this:

201 202 203 ... 209 210 x x x x x x x ... x x 100 101 102 200

What I want is a nice little program that will re-organise the directory into
a 'proper' order or even just compress out the deleted entries. The
reorder option of Neodesk 3 does this but a .ttp would be nice 8-)

Sorry if I rambled on a lot here !

1683. Mercury UUCP v1.18

Newsgroup: comp.sys.atari.st
Date: 1991-02-14 21:44:02 UTC
From: geoffc@zebedee.uucp
Message-ID: <0162160@zebedee.uucp>
Source record: 234318

After installing the latest version of the Mercury UUCP package (v1.18) as posted on comp.binaries.atari.st I noticed the following differences from the previous version (v1.15) :

server.prg - crashes with 2 bombs
showmail.prg - crashes with 2 bombs
rnews.prg - crashes if there are more than a couple of news files waiting to be processed

so I reverted to the older version. On a more happy note, expire.prg does work properly now. Other than these I couldn't see any differences from the older version - was there ?

Incidently, does anyone have a better newsreader that is compatible with Mercury (eg: supports 'unsubscribe from newsgroup' and 'kill' files) ?

Cheers

Geoffrey

PS: I still think it's a great package rodney !

1684. nethack 3.0 patchlevel 10 now available

Newsgroup: comp.sys.atari.st
Date: 1991-02-14 22:51:10 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <1991Feb14.175110.8608@uwovax.uwo.ca>
Source record: 234445

NetHack 3.0j (patchlevel 10) binaries are now available for anonymous
FTP from linc.cis.upenn.edu (in the pub/NH3.0/atari directory) and
atari.archive. There are two files: nh30jbin.zoo and nh30jsup.zoo.
Both are necessary; you can't use patchlevel 9 support files with
patchlevel 10.

The new version has no new features, but lots of small bugs are fixed.
The most notable from the atari user's point of view is that a bug
was fixed in the termcap library used to compile NetHack, so that
it now works correctly in an MGR window or over the modem.

1686. Gauntlet II "Ghost Player" problem SOLVED

Newsgroup: comp.sys.atari.st
Date: 1991-02-14 22:55:50 UTC
From: gordon@osiris.cso.uiuc.edu
Message-ID: <1991Feb14.225550.25666@ux1.cso.uiuc.edu>
Source record: 234414

I know how to correct the "Extra Ghost Player" problem. This occurs when you have a printer attached to the printer port, ond it is either off or turned on but on-line. Solve the problem by turning the printer on and put it off-line. (This happens because the 4-player adapter plugs in to the printer port, and a real printer conflicts with the game's expectations of reading the port.) NOTE: I do not know how the game reacts if there is no printer attached.

>with mode = ASCII?

Mode = ASCII simply won't work, so that cannot be the problem. More likely you are trying to use old arc on them (you should have guessed that from the fact that they are ALL .arc files) STrabble.arc, for example has directories included in it. I haven't seen ARC 6.0 for Unix, but it is available on atari.archive in atari/archivers.

>Anybody else who'se posted something: It wouldn't hurt to download your
>posting from atari.archive to make sure it got posted OK. My SORTDEMO.ARC
>is busted, and I'll be re-posting it soon.

I'm not sure downloading `wouldnt hurt' - bandwidth is bandwidth.
STrabble.arc is about 370K you know.

If someone else who has successfully downloaded CRIBBAGE.ARC, FILSPY12.ARC or STRABBLE.ARC could follow-up, that would be a help.

Warwick.
ps. Using old Arc, you'll get a `I THINK YOU NEED A NEWER VERSION OF ARC TO UNPACK THIS FILE' type message.

Message-ID: <40250011@hpindda.cup.hp.com>
Source record: 234439

When I was investigating printers (I bought a LaserJet IIP :-) I remember reading (in STart I think) that, while 24 pin printers are much better at printing their internal fonts, 9 pin printers are better for graphics, which is really what you are doing when you use GDOS fonts. Can someone confirm or deny this?

While a laser printer may be out of your budget, an HP Deskjet can be had for not much more than your nicer 24 pin printers. Of course if you also want to do program listings, the DJ is probably a little slow. Of course, my opinion is biased since I work for HP. But, they're really nice printers... honestly. :-)

Your pal
Mike Goo

1690. Re: Flight Sims (cont'd)

Newsgroup: comp.sys.atari.st
Date: 1991-02-14 23:27:18 UTC
From: goo@hpindda.cup.hp.com
Message-ID: <40250012@hpindda.cup.hp.com>
Source record: 234438

Many flight sims (and other games...like StarGlider) can use the mouse to simulate an analog stick (my personal favorite is F-19). The problem is that the mouse doesn't auto center very well and doesn't react well to quick movements (essential when dogfighting).

One solution to this problem is the Gravis MouseStick. It is a proportional joystick that plugs into a smart adaptor that, in turn, plugs into the mouse port. The stick itself is pretty "dumb", but does allow a wide range of tactile adjustments (button functions, joystick play). The cool part is the smart adaptor that allows more adjustments than any human being could want. Here's a sample:

- digital joystick emulation or proportional
- button autofire
- screen size (set vertical and horizontal pixel range)
- many more

I don't think that it replaces the mouse very well, but for flight sims, it is great! I can't imagine going back to playing timing games with an old digital joystick just to maintain a certain angle of bank.

Of course, I own one of these and these are my opinions. Your milage may vary. I am not associated with Gravis etc. etc. blah blah blah.

1692. pfxpak patch

Newsgroup: comp.sys.atari.st
Date: 1991-02-15 01:16:35 UTC
From: fischer-robert@CS.YALE.EDU
Message-ID: <28743@cs.yale.edu>
Source record: 234425

Pfxpak, the program which packs executables, is great except that you can't use it easily in a shell script because it makes you press <RETURN> every time it runs. To disable this "Feature", you need to make only a very minor change:

1. Presumably, PFXPAK is packed with itself. So unpack it with the command line:
pfxpak -u pfxpak.ttp pfxu.ttp

2. Starting at byte 520 ($208 in HEX) in pfxu.ttp, you'll find the following in a HEX dump:

6100 0308 3F3C 0001 4E41

3. Change the 4E41 at byte 528 ($210 in HEX) to 4E71.

4. Run PFXPAK and verify that it doesn't make you press <RETURN>!

5. Repack PFXPAK, if you wish, with the command line:
pfxpak pfxu.ttp pfxpak.ttp

This patch disables the GEMDOS call which makes you press a key and replaces the TRAP #1 instruction with a NOP instruction.

Source record: 234430

What has happened to Gadgets by Small?

I have sent them email & faxes, multiple both, requesting my 3.0 update
for Spectre (I am a registered GCR-user). I also asked few questions
about 68030 SST.

I have not received a single reply, anything.

Has someone successfully contacted them recently?

If they have already fallen, (things about Mac ROMs) would someone
kindly send me a copy of that 3.0. Email about arrangements.
(I don't think it violates GbS anyhow, they just save another disk.
That's because I am entitled to the free update due to the date of purchase)

But if GbS is alive and kicking, I'll just wait for them. (not for long)

If you have any clues, please tell me too!!!

The disk drive is not the problem. It happens when there is anything
connected to your parallel printer port, even if the connected device is
powered off. Thus, the solution is simple: just remove anything from
the port and the game works fine.

Hope this helps,

Techno

Did you by any chance connect a printer to your ST after the
first few times you used the game? Apparently the adapter
for the extra joysticks uses the printer port, and if there
is a printer cable connected to the port this kind of thing
happens. It happened to me the first time I tried the game
and I couldn't figure out if this was a feature or what.
Anyway, the problem disappeared when I disconnected the
printer. (I find my character severely outnumbered, though.)

1699. Atari Computers for sale!

Newsgroup: comp.sys.atari.st
Date: 1991-02-15 10:34:18 UTC
From: chuck@umbc5.umbc.edu
Message-ID: <5026@umbc3.UMBC.EDU>
Source record: 234433
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

I have two 520ST CPU units for sale:

Unit 1 has 2.5 megs (Z-RAM upgrade) $300
Unit 2 has 1 meg (Piggyback RAM) $200

Units include mouse and power supply, and also have RF modulators built-in.
NOTE: These units do not include disk drives.

These prices are ASKING prices. If you want to haggle, go ahead! I love
a good barter session. If you have some hardware to trade, go ahead and
offer that as well. I'm looking for Atari ST and IBM equipment at the
present time.

If you are interested, just drop me a line at my signature address or call
me at (301) 455-1506 for the personal touch.

Thanks!

++ I have been trying to get gcc 1.37.1 to run on my 1040 with a
^^^^
Fail. You need at least 2Mb to run GCC.

Well, you *can* get away with

#include <stdio.h>
main()
{
printf("Hello world.\n");
}

but that's about it. From my experiences, 16K's worth of code was about the max
that GCC could deal with on a 1040. If you want to play with it under this
limitation, try removing all your ACCs and running it under gulam, or even
jbammis gnums (minimalist shell).

PvO> I see some patch versions on atari.archive.umich.edu, but I don't know if
PvO> they are the same versions or better, or worse. Maybe somebody from the
PvO> archive management can comment?

PvO> atari/gnustuff/tos:
PvO> -rw-rw-r-- 1 226 121584 Aug 15 1989 patch.zoo

PvO> atari/utilities:
PvO> -rw-rw-r-- 1 226 91023 Apr 12 1989 patch.arc

It seems that the latter one (patch.arc) is a very old one (compiled with
gcc 1.23), and it looks like the one I had.

The patch.zoo file is more recent, ported by bammi, with supposedly is
better (I have not yet tried it).

>>>>> In message <1991Feb13.042250.26102@chinet.chi.il.us>, saj@chinet.chi.il.us (Stephen
Jacobs) (SJ) writes:

SJ> I don't know if this is the problem, but the version of patch.ttp that

You probably mean ^M^J.
SJ> the desktop). I haven't characterized the EXACT behavior, but I get
SJ> the best results by putting both main file and patch into UNIX style
SJ> before applying the

Bammi told me to use the -l switch.

By the way, I think that the TOS utilities that deal with text should
generally accept both the LF only (Unix style) and the CR,LF (TOS style) of
line delimiting. I know that the TOS style is THE legal way, but it
generally doesn't harm to accept the Unix style.

This brings me to another question:

I am porting the GNU diff(3) programs and now I come to an intersting
problem: What to do when comparing two files that differ only in the CR?
I.e. one file is a TOS style, and the other is a Unix style text file, with
the same contents. My initial solution was to disregard the CR completely.
But somebody who tested the thing complained about that. But how do you
output the differences if you want to consider them different?

1. If you take the "official" TOS stand the Unix style file is just a
single line. But this seems impractical.
2. Print a warning but no diffs
3. consider the files to be completely different. But then there is no way
to indicate what the difference is. You cannot put the CR in the diff

because the CR is not part of the line, it belongs to the line
separator. And there is no way to indicate the ABSENCE of the CR.

GNU diff has a -a (ASCII) option. I think I will consider the files the
same if -a is given, and different otherwise. But still the above mentioned
problem remains.

1702. sozobon/dlibs patch

Newsgroup: comp.sys.atari.st
Date: 1991-02-15 13:06:20 UTC
From: piet@cs.ruu.nl
Message-ID: <4866@ruuinf.cs.ruu.nl>
Source record: 234432

I have now also patched the dlibs included in the sozobon package in our archive. I should have done this immediately, as the patch wasn't hard.

Those that got the sozobon.zoo at or after Feb 9 should have the correct version. You can check by the date of dlibs.a in the archive. It should say Feb 8.

If you have the old version you can get the update from our archive:

How to get dlibsupd.zoo from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be a valid internet or uucp address. For bitnet users name@host.BITNET usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between about 20.00 and 0900 UTC).

ftp archive.cs.ruu.nl [131.211.80.5]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
cd /pub
don't forget to set binary mode if the file is a tar/arc/zoo archive, compressed or in any other way contains binary data.
get ATARI-ST/lang/dlibsupd.zoo

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/lang/dlibsupd.zoo
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

>It's not as bad as you make it out to be. First of all, all of the

True, as long as a machine is still usable for what you need it
for, and doesn't frustrate you because you know it could be done
faster, who cares how much CPU time is being used up?

I was trying to balance the argument with the little talked about
downsides of multitasking -- maybe I overdid it. There are lots of
cases in which multitasking will save you time. I decided to point
out some in which it doesn't, and found quite a few in the process.

Again, I actually prefer to use multitasking, if the slowdown (and
other things) aren't so bad as to outweigh the benefits. Mainly, I
wanted to debunk any notions that may have existed that multitasking
gets you something for nothing; that you could have 10 busy, scrolling
screens running side by side in different windows, and that they would
all be chugging along at the full-speed that you're used to on your
single-tasking machine.

>interrupts (mouse handler, etc.) in the ST can slow down any program
>as much as or more than a multi-tasking scheduler. The ideal way to

The way the mouse was done on the ST happens to be one of the things
that I liked most about the original O/S. Machines 10 times more expensive
exist that cannot approach the quality of it (the clicking is another
story). Yes, even the fast, 12.5 MIPS Sparcs running Unix/X-windows have a
'mushy' feel to the mouse tracking, and a skipping mouse cursor with a
painted-on appearance, by comparison.

>multi-task is to have the foreground program at full priority, and the
>background program(s) at low priority. ie. if you are writing something
>in an editor, the editor does not wasted CPU time while it is waiting
>for a keystroke, and the compilation process in the background can use
>all of the CPU, and the compilation process bides its time until the

Not *all* of the CPU. Even though you may not notice it, part of
the CPU time has to be going to the taxman, simply because there's a
timer interrupting the processor constantly, waking up the scheduler
many times a second to check if it is time for another process to run.
And this is the *efficient* way to do it.

>don't find microemacs sluggish, even when virmf is making a new TeX
>font in the background! If you have a slow hard disk, however, any

That's how it should be. But a lot of implementations out there are
processor (and memory) hogs, and do make you wait for a keystroke.

As far as MiNT is concerned, know that you have been spoiled.
This product has achieved Unix source near-compatibility, while at the
same time imposing what is in my opinion a respectably very low CPU
overhead, and a low memory overhead (by comparison) at the same
time.

Other implementations out there for other machines don't shine so
brightly. (I won't name names in the interest of not throwing spoilt
apples at other companies, but...) Have you ever used a presumably
fast machine that used cooperative multitasking? The 40% overhead figure
that I mentioned above would not seem unrealistic to you after using one.

So as you can see, it could be worse. It could be a LOT worse.

>disk-bound process can slow down all the tasks. However, when I am

How's that? With DMA, you'd think a slow hard disk and a fast one
would burden you about the same (not much).

>running only a single task under MT C-Shell or MiNT, I cannot notice
>any speed difference between that and TOS.

Could it be possible that MiNT implements a rewrite and speedup of
the Bconxxx O/S calls, and that's why typing and printing text
on the screen does not seem that slow? Is it just me, or is scrolling
actually FASTER under MiNT?

Hate to correct you both, but every LaserJet HP has sold contains a 680X0.
I may be wrong on this (time for someone from HP Boise to jump into this!)
but I'm sure there are more LaserJets than Macs out there by now. It's
hard to beat a sales strategy of "gain more respect, add more features, drop
the price again." If Apple had followed this strategy, I'd be typing this
in from a Mac II.

>have to exit your sequencer program when you want to load your patch
>editor or librarian.

Yes, OMEGA let's you load and run *ANY* program from KCS. I've used
my wordprocessor this way. The catch is that once you exit the loaded
program, it is completely gone from memory unlike standard Dr. T's
MPE modules.

>KCS is a *very* powerful sequencing program. It allows you to

>never really gotten a handle on it. It is designed as a generalized
>sequencing mode, that allows you to start and stop sequenced
>segments as you wish, or even write sequences that start and stop
>other sequences, but I have always found it confusing...

Well, for me, Open Mode is what I love about KCS. Sequences can
do anything: start other sequences, program changes, controller
events, random events - in any mixture. It has changed the way
I create music. Sequences (containing notes or otherwise) can
be developed like subroutines. Hierarchies of sequences (overlapping
or otherwise) can be easily constructed. In Open Play mode, you
can interactively play (i.e. trigger) sequences by hitting a computer
keyboard key associated with the sequences toggling them on and off
at will. If you wish, KCS will make sure that the timings of
mutliple sequencei triggering will be in sync. Of course, you can
have sequences that consist of nothing more than *timing* information.
It *can* get confusing, but it doesn't have to be if you keep things
simple. I find it very similar to the way I code software ;-)

>The other section of KCS that I have never ventured into is called
>Programmable Variations Generator (PVG). It allows the program to
>randomly alter sequences you create with KCS to add color or

>variety to repetitive sequences.

That's the tip of the iceberg! With PVG you can do things like specify 2 different sequences and have intermediate sequences generated that transform one into the other. Or you can do more mudane things like strip notes above or below a certain velocity. Or generate a new sequences with the notes of an existing sequence that have some attribute you want isolated. So besides semi-randomly generating new sequences, you can create useful sequence filtering tools (and save them like macros) with PVG.

>I guess what I like the most about KCS, is that there are so
>many ways to skin the cat. I don't always write songs the

>explore musical ideas in new ways, and that can really spur
>your creativity. The trick is not to let all of the options
>overwhelm you... bite off a little at a time and go with it.

The above says it all. The options seem endless.

For those who are into algorithmic composing, check out Tunesmith (MPE module). It generates tunes, up to 7 parts (I think) based on algorithms that you can tweak forever. It also provides a bunch (48?) of ways to musically transpose these tunes. The best think about Tunesmith is that the tune generation takes place interactively. I've sat with it for an hour at a time, stimulating it to create...and then keeping the occasional gems that come out of it. Fun stuff.

If anyone is interested, I have an extra copy of KCS Level II with PCG, and Tiger (original diskettes and documentation) that I would be willing to sell for a very reasonable price.

The VMS difference program shows "<CR>" (ie: 4 ascii characters) at the end of
the lines if one file has them and the other doesn't.

>GNU diff has a -a (ASCII) option. I think I will consider the files the
>same if -a is given, and different otherwise. But still the above mentioned
Most definitly have a switch to disable this feature. The VMS utility does not
and it is a real pain. Yes I want to be able to find out if the files have
different line terminators, but once I know that I want to see the diff's
excluding the terminators (which would be the whole file of course).

From: Daniel_Roedding@fiction.ms.sub.org
Message-ID: <208348@fiction>
Source record: 234466

Some strange things about the <Esc> function in the DeskTop...

Just try an assembly from 0xFE75E0 (TOS 1.04), you'll see a *really*
dirty hack!!

When you press <Esc> on the DeskTop, the following happens:

1) hdv_bpb and hdv_rw are patched
2) hdv_mediach is changed to a routine that always returns "2"
3) The DeskTop opens a file "Drv:\\X"
4) This call *must* use the Getbpb()-function, otherwise the redraw
routine is teminated!
5) The vectors are restored and the new directory is shown

So when you write your own device drivers on GEMDOS level, you *must*
use Getbpb at a file request on "Drv:\\X". It took us almost a week to
find out about this...

IS THIS REALLY NECESSARY????

Daniel

> software, but multitasking under software is not multitasking. A
> multiprocessor board is neccessary for true multitasking.

Not by any reasonable definition of multitasking I've ever seen. Amigas multitask, Unix multitasks, virtually every other "real" operating system out there (depending on how you label MS-DOS) multitasks without special hardware. Well, maybe an MMU, but no multiprocessors are required. Read an OS text to learn the difference between "multitasking" and "multiprocessors".

My bried summary: "multitasking" is achieving the illusion of doing more than one thing at a time, to give you a convenient user interface. But the total CPU time required to execute two processes is the same sequential or parallel. A "multiprocessor" is something that will execute >1 instruction at once, where those instructons may all come from the same process - ie, one need not multitask to take advantage of a multiprocessor. The sole purpose of a multiprocessor is to make things run faster; it is entirely orthogonal to the issue of multitasking.

1720. Daisychaining HDs

Newsgroup: comp.sys.atari.st
Date: 1991-02-15 19:12:50 UTC
From: mlake@irscscm.UUCP
Message-ID: <1991Feb15.191250.26833@irscscm.UUCP>
Source record: 234303

I'd like to relay a problem I've been experiencing to readers here in an effort to find a solution or gain some insight into the cause.

For the last several years I've been running a 520 ST (1/2 meg, TOS 1.0) with an old Supra 20 MB drive with nary a problem. I have always used Supra's booter to boot from floppy. Recently I purchased a Supra 80 MB drive and set up my system to daisy chain the 20 onto the back of the 80. I altered the internal SCSI assignments so that the 80 is 0 and the 20 is 1. I used SUPEDIT to change the partitions on the 20 from C, D, and E to H, I, and J. The 80 was preformatted with partitions C, D, E, F, and G. I set the booter up to boot from HD. The problem occurs at boot time. The following scenerio happens 95% of the time when I boot my system:
Power on. After a couple of seconds the screen displays a floppy only system in lo-rez. Press reset. After many seconds the system appears to boot correctly displaying all partitions in med-rez. But neither of my floppy drives are accessible by the system. Press reset once again. After many seconds the display comes up again as it did after pressing reset the first time. And now both floppies are accessible by the system.

Additionally, it is *very* difficult for me to boot a program from floppy. Holding down <CTRL><ALT><SHIFT> does not always tell the system to boot from floppy. It seems to works on an erratic basis. Even powering down the HDs does not fix this problem.

Does anyone have any insights/suggestions/fixes for my problem(s)?

>price being the main one! If you are posting from outside of the U.K., price
>will probably not be that useful, unless the company concerned ships abroad.
>Replies by email please, if anyone else is interested in the results, I will
>be happy to forward them.

Brilliant no e-mail address included, oh dear.

I recently went to the Computer Shopper Show at Wembley, England.

And there I spotted my dream come true, a 42Mb Hard Drive at an
incredible price of only $(English)299.99, it was a Power Drive
9000 series.

Bit big and noisy, but generally nice.

I understand that this was a stock clearance price, but there may
be more available.

Hope this helps,

Andrew Thompson

1723. Atari ST and JNT-PAD - Summary of responses

Newsgroup: comp.sys.atari.st
Date: 1991-02-15 21:03:22 UTC
From: ngse18@castle.ed.ac.uk
Message-ID: <8517@castle.ed.ac.uk>
Source record: 234315
Cross-posted to: uk.misc,comp.sys.atari.st

A few weeks ago, I posted a request for information from a colleague who had had problems with Atari ST's being used as a terminal connected to a Camtec JNT X.25 PAD; the line drivers at both ends of the circuit had blown several times, and our comms people had suggested that the problem lay in the Atari.

We received several suggestions, many pointing out that it was rather hard to believe that the Atari could generate a significant overvoltage when it contains only 5V and 12V supplies (in fact the Atari concerned was fitted with an external PSU). Several respondents suggested the possibility of a lightning induced pulse, but there was no such association with any of the instances of failure. One respondent did suggest that the earthing arrangements on the ST were less satisfactory than some other micros. In short, no-one was able to offer a reasoned explanation why either of these devices should be blamed for the failure, or substantiate the suggestion of our comms group that the Atari contained a well known defect in this area.

The comms folks have now backed off their position of wishing to ban Atari ST's from connecting to the JNT X.25 PADs, and have provided my colleague with surge protectors fitted to both ends of the circuit between his Atari and their PAD. It appears to have been implicitly accepted by all that there must be something about the wiring of this particular circuit which produces (presumably inductively induced) surges from time to time.

Our thanks to all who responded.

Atari Microsystems Corp is a wholly owned subsidiary located in
Dallas, TX with primary hardware design, product engineering, and
document control responsibility for most of the 68000 family
and some of the IBM compatible family.

Software development, as well as marketing and all types of
corporate decision makeing, is still done in Sunnyvale.

Okay?

I remember a discussion on the net a few months (years??) ago that DLII
is flakey if there are 0 length files in your partion. Does anyone
have any evidence to prove/disprove this claim??

I am also wondering if there are any de-frag algorithms that do
not require bypassing the file system. I imagine that one could write
a defragger by paying attention to the FAT read only while letting
the file system modify the FAT when copying/moving files to
contigious disk space.

1727. Re: Multitasking

Newsgroup: comp.sys.atari.st
Date: 1991-02-16 00:42:02 UTC
From: vsnyder@jato.jpl.nasa.gov
Message-ID: <1991Feb16.004202.26343@jato.jpl.nasa.gov>
Source record: 234455

From 1968 to 1984, I used an Univac 1108, which had 262144 words of 36 bits each of memory (about 1 MB). The operating system used about 32k of this for code, and another 32k for data (heap), leaving 1bout 196k words for users. We ran with 50 interactive users, 10 active batch (background) jobs, and queues of up to 50 or so background jobs. Plus input and output spooling. The machine had 11 4ms drums, each with 262144 words, for swapping. It was expensive, but gave better response than a 6Mhz AT (although the user interface sucked). The key to the performance was that Univac knew how to build a machine that could handle interrupts quickly (2 cycles, because there was an entire duplicate set of registers for the OS), and, more importantly, the operating system KNEW HOW TO USE INTERRUPTS. If you implement multitasking by ticking the clock every k (say 10) milliseconds, and going around asking "are you ready to run", your performance will be more like Unix (30% penalty at least). The switching algorithm used in 1100 OS was what OS theorists call "inverse of remainder of quantum:" Each process has a priority and a "time quantum". A process is NOT interrupted by the clock until its time quantum has expired. Other interrupts, e.g. I/O completion, external event (keystroke or mouse movement), etc may make a higher priority process eligible for execution. If a process willingly relinquishes control, e.g. to wait for disk or console I/O, before using 1/2 of a quantum, its quantum is halved, and its priority increased. If a process willingly relinquishes control after using more than half but less than all of its quantum, neither quantum nor priority change. If a process loses control by its quantum expiring, the quantum is doubled and the priority decreased. By this scheme, the OS overhead for a compute-only task rapidly approaches zero. If your processor and OS both know how to handle interrupts, and the task dispatcher uses decent data structures for keeping track of task priorities, and you don't piss away 1/3 of the cycles fooling with the clock unnecessarily, the performance of a multitasking OS supporting one interactive process should also approach zero.

Another thing the 1100 OS knew how to do EXCEEDINGLY WELL was disk and tape I/O. There were five basic I/O interfaces: overlapped IO, synchronized later by explicit WAIT request; I/O with the OS causing you to wait to get control until the I/O completed (but somebody else got to use the processor); overlapped I/O with pseudo-interrupt at termination; I/O with wait and pseudo-interrupt at completion; and I/O with task termination and pseudo-interrupt at the end. The last has pretty much the same effect as the second, but with less overhead. One might argue that I/O with overlap causes the machine to slow down because of contention between the channels and processors, but if the BIOS sits there and says "hey, are you done? hey, are you done? hey, are you done? ..." a million or so times per I/O, the effect is to have much worse performance than if even half of the processor's cycles get stolen by the channel. On the ST, unfortunately, there's only one DMA for both the hard and floppy disks, so

the most interesting overlapped I/O opportunities can't be realized. But I/O to the disk and printer, for example, could proceed concurrently with computing IF ONLY THE OS WERE CLEVER ENOUGH.

Even if TOS/GEMDOS/BIOS/XBIOS never learns how to multi-task, I'd like to have overlapped I/O to the floppy disks, ACSI, printer, RS-232 and MIDI at least. At the BIOS level, I'd like to give a SCSI block (yes SCSI, not ACSI), and a memory address if necessary. This would make it trivial to write support for tape, ethernet, toasters, etc. on the ACSI channel. I'd be happy to have only "start I/O and return immediately with I/O proceeding concurrently" and "wait for I/O to complete" interfaces to the BIOS. At the GEMDOS (file I/O) level, I'd like to add both of the above to the present "start I/O and don't continue until it's done" interface. Of course, I'd like the same for the rest of the devices. It would also be nice to be able to use interrupts, but that may require something more like a multitasking kernel.

Enough of a tirade for now. Maybe more later. In general, I don't think TOS/GEMDOS/BIOS/XBIOS preclude intelligent I/O, or even multitasking. One doesn't need all the clanking machinery of Unix. [Aside: The hackers who invented Unix were rebelling at the size of Multics. Unix is now about 5 times the size of Multics, and doesn't do more than a few extra things (mostly networking stuff).]

>many times a second to check if it is time for another process to run.
>And this is the *efficient* way to do it.

It's most definitely NOT the efficient way to do it, if you have an adequate clock. The *efficient* way to do it is to give the process a time quantum, set the clock to interrupt WHEN THAT QUANTUM HAS EXPIRED, and DON'T USE CLOCK INTERRUPTS FOR ANYTHING ELSE. What purpose is served by getting clock interrupts every 10ms, only to discover that what you were doing is what you wish to continue doing? 'Way back in '72, Madnick and Donovan described this notion in their text "Operating Systems". Petersen and Silberschatz did a good job too. I've not taught an operating systems class in over 6 years, but I've been told that Tanenbaums book is excellent. Better yet, get hold of Univac 1100 OS listings -- Univac hasn't gone OCO yet, so most any Unisys 1100 site has them.

Sorry to keep harping on this. I just can't understand why nowadays one requires 196k to do 10% of what could be done in 90k 25 years ago.

Van.

nut@nuthaus.UUCP {hoptoad,well}!wet!nuthaus!nut nut@wet.UUCP writes:

Perhaps with the rumoured Mac OS clone coming soon at a dealer
near you, Spectre will be saved. It seems to me that an intelligent
company selling a cloned edition of the Mac ROMs would not halt
their distribution to a paying customer (maybe GBS could even make
the entire thing into a card and not bother with the cart!).

I really don't think so. First of all the implementation is
not really ST accessable. Mainly because as so many other people
have pointed out it uses the Motif/X Release 4 interface which is
so large that you people would need 4 megs for just a good (complete)
implementation. And a 8Mhz 68000 running X is something I don't
want to think about using.

What it does do is open up the possiblility of Mac programs being
transportable to the mainframe world, perhaps with a little rewrite
here and there, Mac program could be running on the nearest super mini,
386/030 machine nearest you!

Really, the MAC ROM problem is quite a nasty problem. I have tried
to call gadgets inc many a time to cancel my order as:

Spectre GCR 299 + MAC ROMs 273 = ~600, another hundred I could get
a Mac Classic at dealer cost. And from what I here 273 is an excellent
price for the ROMS.

I am really steamed. Apple is engaging in guerilla warfare and
I am going to get my ROMS APPLE if I have to either BY THEM LEGALLY
or obtain them WITH OTHER MEANS at MY DISPOSAL.

I really wish more guys like Denis Hayes existed so that we could
REALLY give Apple some blows, economically. There is absolutely no
competition between Apple and other companies because Apple decided
everything Xerox Park worked on was actually theirs to use, and no one elses.
People are forced to buy Apple technology at premium prices. I think
the Supreme court should tell Apple that the technology to transform
Xerox Park's work should be PUBLIC DOMAIN, after all, look what happened
to AT&T. Now we have competition, we can actually use phone lines
now with 9600 baud modems because these companies worked to improve
their communications equipment.

---For a safer world, I would like to see thousands of people do what
Denis Hayes did, Apple would be forced to drop its shorts and eat'em.

Or how about an IIfx for 1800.00 bucks?

I just downloaded the Little Green Footballs File Selector version 1.8B.
It doesn't seem to work for me. I have a hard disk with an ICD Advantage
Plus host adaptor and associated software. When I boot, the other utilities
seem to load, but the LGS (in the auto folder) hangs, or else the system
reboots continuously. I also have the "idle" screen saver program and the
program to park the heads of a 5.25" floppy.

I know a previous version of LGS worked (version 1.6), but I don't have a
copy of it, and haven't been able to find it on any archives.

Any advice or help in locating previous versions of LGS would be appreciated.
I like the program very much, and definitely think it's worth the shareware
fee (which I'll gladly pay if I can get the latest version working).

Both Z*NET and ST Reports extract and reprint messages from UseNet, GEnie
and CompuServe all the time without giving credits or asking permissions.
Many times the messages, for example messages from Atari's Bob Brodie
answering questions on CIS, are extracted without even using "quote marks",
giving the impression they are original material written by the "magazine's"
"staff writers".

All with no concern for copyrights... interesting form of "journalism"...

Sam Tramiel, president of Atari Corp. will be the special guest at an online conference this Thursday in the CompuServe Electronic Convention Center. That's Thursday, Feburary 21 at 10 PM, Eastern Standard Time.

As a special service to Atari owners, CompuServe is making the conference available *FREE* of normal hourly connect charges..!

To enter the Convention Center, just type GO ECC after logging into CIS.

If you have a CompuServe account, or know someone who has, this will be a wonderful opportunity to listen to, and talk with, the head Atari Corp.

If you don't already have a CompuServe account, you can call 1-800-848-8199 (ask for operator 198) and request a free signup kit which includes some free connect time... unfortunately I don't know if they would be able to get it to you before Thursday...

> Does anyone know if these two compilers have any kind of support for DRI link
> format?

Turbo-C supports the DRI format as well as it's own link format.

> I know that one of the problems with link format support is the calling
> conventions used. DRI stacks the parameters and use words or longwords.
> Un*x style would stack only longs and passing paramters in registers would
> also increase speed. Perhaps these optins are selectable.

Turbo-C normally passes as many parameters as possible in registers. You can
turn this off for any function with the declaration 'cdecl'; the parameters are
then passed on the stack.

>For the benefit of us ignoramuses (ignorami?) - what IS Spice?

SPICE = Simulation Program with Integrated Circuit Emphasis

It is an electronic circuit simulation program. You supply the "netlist"
and component parameters and it can calculate voltages/currents/waveforms/
power and many other behaviorial parameters of that circuit.

Very useful when you can't "breadboard" the circuit for some reason, or
if you want to test the circuit under conditions that might damage real
components. Also much easier to examine simulated waveform graphs than
to try to get the waveform on a scope (especially for transients)

>>Right now the problem is overly strict system administration at your end.
>
>I concur.

Although this is mainly Jon's department, I think you are all missing a key point. The reason the archive exists at all is due to our system-administrator. The reason we have more than the disk space we need is because of our system-administrator. Is anyone in the computing center administration telling him he needs to let us keep the archive here? NO.

Some fairly intense reasearch occurs here, and machine resources are not to be taken for granted. I think it's quite fair that bart was taken down to due it's abuses (intended or not). At least the archive is allowed to remain, even if it is only accessible by ftp.

How many of you gathered most of your st stuff from here when you first started out? How many of you look here first for the latest PD releases? How many of you know that there isn't any where else to go for digitized sounds? Well, underlying it all should be a deep gratitude for our system-administrator. Without him, none of this would be possible in the first place.

Easiest solution of all:

Grab the sword, turn completely around, throw the sword and immediately take one step forward.

There's no reason to take more than a few points damage from the first poison trap if you step out of it quickly. The other poison traps are only triggered if you're holding the sword, so you can leisurely walk back to the door, open it, then take the sword and walk out almost untouched...

I think that the title says it all. I just got my MasterCard bill last week and Gadgets was listed for the withdrawl on January 15. It seems to me that it is now a month later. I realize that Small and co. are probably extreemly busy with upgrade orders now, but when you promise 2-3 weeks, it seems like you should keep close to it. If I hadn't sent off my card until the 15'th it wouldn't be so bad, but isn't it standard business practice to charge the customer only when the product has been shipped? If you have received yours let me know what you think of it, and more importantly will it run Pagemaker 4.0 and WordPerfect 2.0 under MultiFinder without crashing? They both run fine for me under Finder, but under MF, it's just a matter of time before I get the crash page, or the system just locks up (that is, if I can even get either loaded up without crashing).

brian@.Waterloo.NCR.COM (Brian W. Gamble) writes:

- QUESTION ONE
- Do you need to do anything special to get 1.44M out of it? I can't
- seem to get it to read a HD disk... I've found a SW/PD formatter
- called Diamond Format, which formats to 1.44M (or 1.6M if you use
- more sectors than usual). It also seems to be a stand-alone portion
- of a hard drive backup program. Do I need to find a special driver
- or something? The drive works fine as a double density...

There is a product called the PowerDrive. It comes in two parts: a
drive controller replacement and a 1.4meg drive. You can buy the
drive separately, but you must by the special controller from them.
I think it uses the faster WD1772 (is that the right part #?)
controller chip. The board itself costs $139.95. I think they
recommend a Teac drive.

A friend of mine has this installed on his 4meg STe. He says, not
only is the 1.44meg drive faster, but his external 720K Indus drive
jams. He says you can see on the track reading that it's much
faster. However, he adds that there is some incompatibility with
copy-protected games.

DreamPark Development
1390 So. 1100 E. Suite 104
Salt Lake City, Utah 84105
(801)-484-9809

- QUESTION TWO
- Does anyone know where I could find a 14 pin DIN (ie, the ST's external
- floppy drive port) plug adapter, that has a female 34-pin (ie, the
- floppy drive's bus) port on the other end? Or am I doomed to building
- one? Given the half-dozen or so 3rd party manufacturers of external
- drives for the ST, a part like this HAS to exist, right?

1750. re: Multitasking

Newsgroup: comp.sys.atari.st
Date: 1991-02-16 19:43:51 UTC
From: miskinis@aisg.enet.dec.com
Message-ID: <3997@ryn.mro4.dec.com>
Source record: 234494

Yes, the last reply regarding multitasking is quite correct...

The standard (GEM) Atari desktop has a limited multitasking shell built into it. This can be demonstrated easily by invoking a desk accessory while windows are being re-painted (like when exiting an application). The desk accessory will become the current "process", and the window that was in the middle of being repainted will freeze. As soon as you do something in the desk accessory (click a button, etc.) and the desk accessory continues running, the window(s) will finish repainting, and then control returns back to the desk accessory...

Anyone who's a GURU, and is familiar with Atari ST MIDI and/or MFPINT, please check out my MIDI postings in comp.sys.atari.st.tech... I'm trying to solve a problem with MIDI input, by replacing the level 6 interrupt handler. I'm having a problem getting a pointer to the original one, so I can restore it upon application terminantion...

* FOR SALE *

FoReM BBS version 2.2. Release B
- an FNET/Crossnet-compatible, full-featured BBS program

Includes: ~ original disk in original, perfect condition
~ original manual in original, perfect condition
~ original box in original, perfect condition
~ Help from me if you need it when setting up the BBS

If you include five double-sided or ten single-sided disks with your
payment, I will copy to them five double-sided disks of FoReM
BBS-compatible on-line games and utilities. Also on those disks is
the latest version of FoReM BBS obtainable without an upgrade fee.

All the BBS software you need for an awesome BBS for only $50!

For an extra $5 each item:

~ 10 disks of up-to-date PD/Shareware utilities
~ 10 disks of up-to-date PD/Shareware applications
~ 10 disks of up-to-date PD/Shareware digitized sounds
~ 10 disks of up-to-date PD/Shareware TSRs, DAs, modem utilities
~ 10 disks of .TNY pictures
~ 10 disks of Spectrum 512 pictures
~ 10 disks of PD/Shareware games
~ 8-10 disks of informative text files

For an extra $10 each item:

~ 15-20 disks of excellent graphic/sound demos
~ 15-20 disks of Cyper (.SEQ) animations

All except approximately 20 files in the entire collection are
compressed using LZH compression to fit more files on a disk. The 20
or so files not using LZH compression use ARC or ZOO for directory
compatibility, or are already compressed as an exectuable file, in the
instance of some demos.

-- All the PD/Shareware software you need for a well-stocked BBS.
Your users will love you!

>

Indeed, there's a very simple defragmenting algorithm that uses only the
file system: copy all files to a backup medium, zero the partition, and
copy the files back. (Make sure the backup is file-by-file, *not* an
image backup). It's probably a good idea to make two backups before
zeroing the partition, just in case.

It's not the job of the linker to generate the code for passing parameters.
The compiler should do that. Obviously if you want to link modules from
different compilers, they have to agree on where they are going to put/find the
parameters.

1758. Abacus 3D Programing Book, Need help converting source. (PLEASE

Newsgroup: comp.sys.atari.st
Date: 1991-02-17 04:10:52 UTC
From: Bobster@cup.portal.com
Message-ID: <39359@cup.portal.com>
Source record: 234500

I am having troubles converting the source code in Abacus Software's Atari
3D Graphics, into a flight simulator type program as
described in the book on pages (327-328). On these pages it says I should modif
y the MULTI1.S code the following ways:

1: Modify the "pointrot" routine so it does not transform all the
world coordinates back to the old coordinate origin. (Check!)

2: Change the position of the projection plane to the coordinate
origin. (I think it is already set that way... Check!)

3: Make the rotation reference point the coordinate origin. (Check!)

All of this is complete, but I get a messed up display of the houses.
(The hide line routine has deleted lines that it should not. Also, it
still appears to be viewing from a distance. Is there something else
I need to change?)

Please, if you have completed some code that will do this, can you send it
to me? I am sure soneone out there has done it. Thanks in advance! (Any help G
REATLY appreciated!)

Thanks!

1759. new uploads to atari.archive...

Newsgroup: comp.sys.atari.st
Date: 1991-02-17 04:14:48 UTC
From: millert@tramp.colorado.edu
Message-ID: <1991Feb17.041448.17036@csn.org>
Source record: 234499

The following files have been uploaded to atari.archive.umich.edu and should be appearing in the atari/newitems directory real soon now... :-)

icon90.lzh - NeoDesk Icons - Best of '90 (may be for Neo 3 only)
icons4.lzh - more NeoDesk icons
loudform.lzh - talking disk formatter
dc_fkeys.lzh - assign text to function keys - up to 49 keys available
translat.lzh - german -> english translater (generally gets about 40% right)
vdifx110.lzh - fixes a bug in the vdi (german docs so I'm not sure what bug)

1760. BART - gone?

Newsgroup: comp.sys.atari.st
Date: 1991-02-17 06:53:36 UTC
From: Mark.Onyschuk.Of.250/744@p0.f744.n250.z1.fidonet.org
Message-ID: <331.27BE8D00@egsgate.fidonet.org>
Source record: 234373

I caught a message header which stated that BART was no longer available. I wasn't able to find the original notice in the message base, so I hope this is simply rumour.

If it is true though, I was wondering if there was some other archive i could access through the mail rather than through FTP (my access to this utility is limited to a large extent)?

Best Regards,
Mark Onyschuk

> --
> Ed Krimen .....

THis was in some messages that I was reading, I not to sure if I still have them saved, as I have lost my 'C' root directory of my hard disk , because of a STE, DMA problem.
But I was having problems with DCshow, it would stop it running, gave TOS error 35, if I remember, has not had any problems since Ive set it off ie. PRX.
On another Note; is there a Utill that I can use to Read sectors on my Hard Disk, and edite them with a insert mode, all my root directory names have been moved 2 bytes to the left.
I don't like the idea of retyping over 3000 bytes, so to be abell to read in the sector and shift the data right by 2 bytes will fix up the damaged directories..Thanks...

MACCELL itself is not buggy but interacts with some programs strangely. (e.g. WordPerfect, as reported in Genie.) The only bug I have ever seen was with MACCELL2 and it's "watch modem" feature - never could get it to work.

1764. Demos on Terminator Hz problem?

Newsgroup: comp.sys.atari.st
Date: 1991-02-17 14:54:25 UTC
From: JJL101@psuvm.psu.edu
Message-ID: <91048.095425JJL101@psuvm.psu.edu>
Source record: 234307

I downloaded final cut, acid2, neworder, and such demos from terminator's
ftp site. I got New Order to work fine. Hoewever Acid2 says one or 2 words th
en bombs, and final cut will give me the opeinging screen but then sit forever
when I press the space bar to start the thing. However, if I use the changehz
program that comes with it, the program seems to work fine, but my tv is
flipping horizontally badly. I am using a 1040 ST. Is there any way around
these problems? Any responses would be greatly apprciated.

1766. Gribniff Developement Toolkit

Newsgroup: comp.sys.atari.st
Date: 1991-02-17 16:10:26 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <12278@helios.TAMU.EDU>
Source record: 234308

Last summer I received a newsletter from Gribniff software announcing as the new Neodesk products. Promplty I got my checkbook and was about to order everything on the list. Then my wife saw what I was doing, and took my checkbook and credit cards away.

Now, I have her blessing to buy one piece of ST software at a time a couple of times a year with her permission (boy what kindness). I am looking to get the Programming Toolkit (or whatever the name is). However I have a few questions:

o What compilers does it work with (or is it an independent compiler) ?

o What types of screens and windows can you make with it? For example, Is it just a GEM/AES/VDI replacement or does it offer extra features?

o I would like to make my software have a similar appearence to the OSF/Motif standard

Does anyone think this is feasible?

1768. TT in Memphis, TN

Newsgroup: comp.sys.atari.st
Date: 1991-02-17 17:15:06 UTC
From: tony@tacky.cs.olemiss.edu
Message-ID: <1991Feb17.171506.9438@cs.olemiss.edu>
Source record: 234310

Well, I played with a TT in Memphis, TN yesterday. It was pretty
fun. The store had:
TT030 (price: w/2MB RAM and 50MB HD, US $2,999 or $2,500, I don't
remember. I'd go with the higher price for now)
Mega 2 with Viking and SLM804(?)
1040
1040STE
Plain Mega 2

No MegaSTE, though. The store owner showed me the TT's desktop and it
was fun, but one thing I noticed was the redraw speed of window text
was a DOG! My 1040 with QuickST seems faster! Did Atari forget to
fix the drawing routines? The TT was connected to a SuperCharger, but
I couldn't find the Mess-Dos disk to boot the DOS part.

A few Amiga HAM mode pictures were converted to the new TT resolutions
(TT low?) and looked neat (better than Amiga, no color-wierd-things)

[and no flames from the Amiga readers. OKAY?!?!]

The store owner said the problem was availablity. He can't get TTs.
Atari, maybe you should start paying attention: Could this be Demand?
Do you have an Economist? Or are you smarter than we all think you
are and are trying to drive the price UP?

(after years of being the only ST around for miles, I found a very
active user group in Mempho. I've known of them for a few years,
but the extent of their activity was unknown to me.)

Tony

1769. Changes at atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-02-17 21:36:15 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Feb17.213615.4716@terminator.cc.umich.edu>
Source record: 234313

Those of you using the archive will notice some changes over the next
week:

I. The index has gone from a ls -lR listing to half text/half ls. There
was finally enough of the descriptions finished to warrant this switch.
One fo the many benefits of this format is instant index updates. Another
of course is knowing what you d/l before you d/l.
Expect the remainder to be completed within the week.

II. Some fo the directory structures will be upgraded. The biggest change
will occur in the utilities directory, where utilities will now be grouped
into subdirectories, such as doubclick (DC Software), desktop (files
pertaining to the desktop), mouse (mouse accelerators, etc.) virus (virus
killers, simulators, etc.) and so on. Please bear with me during
this process. This directory is likely to be highly unorganized for the
remainder of the week or so. Pardon my dust :).

Have fun,
weiner

1770. Mouse hygiene

Newsgroup: comp.sys.atari.st
Date: 1991-02-17 21:45:23 UTC
From: thaanuj@mist.cs.orst.edu
Message-ID: <1991Feb17.214523.732@lynx.CS.ORST.EDU>
Source record: 234314

I used to have my computer set up on an ugly, home-brew plywood and 2x4 desk. Using the mouse on such a surface was jumpy and inaccurate. I bought a mouse pad a couple of months ago, and I love the feel. However, my mouse (plain old atari model) gets dirty much quicker, and the problem seems to be getting worse. When I first got the pad, the mouse needed cleaning about once a month, but now it gets really gunked up after only a couple of weeks. Within days there is noticeable buildup on the rollers.

What surfaces have you found to be comfortable yet sanitary for operating a mouse on?

Thanks for any advice or hints.

John Thaanum thaanuj@prism.cs.orst.edu

>4) This call *must* use the Getbpb()-function, otherwise the redraw
> routine is teminated!
>5) The vectors are restored and the new directory is shown

You have uncovered the approved way of forcing Gemdos to recognize a media change. Normally, Gemdos recognizes a media change when the media has really changed, e.g., when you pop out one floppy and put in another. When media changes, Gemdos flushes its (now out of date) cached FAT and directory information and reads afresh from the new floppy. However, sometimes Gemdos fails to recognize the change, for example, if the new disk has the SAME serial number as the old. With newer TOS's, pressing <Esc> forces Gemdos to recognize a media change and flush its buffers. This keeps you out of trouble in those cases where the media change isn't automatically recognized. Thus, pop out old disk, pop in new one, hit <Esc> is safe, regardless of disk serial numbers.

The way in which it is done may seem like a dirty hack to you, but think of what the possibilities are:

1. Introduce yet another Gemdos call. Assign it a number. Document it. Add code. Call it when <Esc> is pressed.

2. Temporarily insert a fake device driver to behave the way any device driver is supposed to behave when the media really has changed, i.e., it returns a "media-change error" until Gemdos calls "Getbpb" (which it does when it begins reading a new disk). Does not require modification of Gemdos OR device drivers.

The desktop does (2). While (1) is in some sense cleaner, the advantages of (1) over (2) seem minor, and the advantages of not having to modify and extend Gemdos are considerable.

>So when you write your own device drivers on GEMDOS level, you *must*
>use Getbpb at a file request on "Drv:\\X". It took us almost a week to
>find out about this...
>
>IS THIS REALLY NECESSARY????

I don't know what you mean about writing device drivers "on GEMDOS level". Device drivers are the lower-level things that Gemdos calls in order to move data to and from a device. They are what you link into the hdv_rw vector. Yes, a device driver does have to understand the media change protocol and to provide Getbpb and Mediach routines for the device (as well as the read/write routine), but it doesn't ever have to deal with pathnames. That Gemdos's job!

What you are talking about sounds like replacing Gemdos-level functions with your own. If you are doing that, then yes, you had better be prepared to make your routines behave like the real thing, since client programs have no way of knowing they are talking to your functions instead of the real Gemdos.

I think your complaint is simply that Gemdos operates a little differently than you had thought. Yes, there is an assumption that if you attempt to open a file after media change has been signalled, then Gemdos will call Getbpb(), even if the file doesn't exist. (How is Gemdos supposed to know that the file doesn't exist until it has read the directory? How is is it supposed to read the directory until it has determined the media parameters with the Getbpb call?) That's all the above code is doing. Doesn't seem that unreasonable, when you think about it. I don't think this is a reason to flame. I do suggest that you become a registered developer and get the necessary documentation if you want to get into the ST internals that deeply.

Source record: 234321

In regard to your question about OSF/Motif

Hi, YES, it feasible on the ST, and I've often thought about it.
This is the type of windowing system I'd like to see on the ST, as I use
Motif in my "real" job.

Have you seen the GFX demo? I believe the author's name is Darren
Schebeck. I tried to contact him via a Canadian BBS, but the user file
was wipped out... The demo shows a few motif-like widgets, and is dated
1990...

I think you'd really have to use low resolution to get enough
colors to be nice looking. Otherwise your background, window background,
top shadow color and bottom shadow colors would depleat the 4 colors
available in mediu

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, and STacy.
There are also emulators for the Apple Macintosh and IBM PC/XT/AT available.
Finally, there is the Lynx (a game machine) and the Atari TT and ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

CSAST
What sort of articles would interest people reading comp.sys.atari.st?
```

==========

The most interesting articles are technical articles, impressions of software/hardware, information on Atari user-groups and shows, or helpful hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better than...', especially when cross-posted outside of comp.sys.atari.st. If you don't know how to eliminate other newsgroups from a reply to an article which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local distribution of comp.sys.atari.st. Those outside the United States have little desire to read about that neat bit of [hard/soft]ware you're selling when you live in the U.S.A. If you don't know how to restrict distribution of a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

PD
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter password>
cd /atari

NOTE: BART (the atari.archive mail server) was recently shut down due to problems with weak quota checking. There is no word as of 17 February whether BART will be running in the future.

For anonymous FTP in the UK: uk.ac.lancs.pdsoft

User pdsoft
Password pdsoft

This is a national public domain archive, available to sites in the UK only via JANET. Mail access is available from within the UK - send mail to archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: unido.informatik.uni-dortmund.de
[129.217.64.60]

Some selected Atari ST software is in the directory pub/comp/atari-st

There is also the info-server, a mail server which (among other things) mirrors the panarthea archives. Unfortunately it is not up to date and presently contains only volumes 1-10. You can get more info about the server by sending any mail to info-server@unido.informatik.uni-dortmund.de. It will reply with usage instructions.

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU programs ported to the ST (including ports of emacs and bash and an extended version of bammis library for gcc) and also ports of software posted to comp.sources.unix, alt.sources and comp.sources.misc.

For the panarthea mail server, see Steven Grimm's monthly posting.
Panarthea holds all of the comp.sources.atari.st/comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so.

ARCS
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features
and quite a lot of documentation
lharc.arc
zoo_bin.arc

Julian Coleman recently (December 1990) uploaded an archive starter pack to the atari.archive server. His announcement reads:

" I have just uploaded an archive starter pack to Atari.Archive. It contains the following :

arc / lharc / uud / uue / zoo
U. Michigan monthly posting (05 Dec 90)

The file is 'starter.tos' and is in the form of a self-extracting lzh archive, so only needs to be downloaded (in binary mode !) and run. The archive contains sudirectories and needs about 350k when extracted."

This is probably the easiest way to get hold of the various archiving programs if you have access via FTP and can transfer the binary file to your Atari ST. The program is located in the main directory (ie. /atari/starter.tos)

There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on atari.archive server. They are:

arcgsh35.zoo - written by Rainer Klute. e-mail will reach him at klute@irb.informatik.uni-dortmund.de or klute@unido.uucp, or klute@unido.bitnet

arcshl23.arc - written by Charles Johnson

Both are located in /atari/archivers

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use thecommand line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?' or 'h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

ERR
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from

Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

```
Error description return code alert box #
=================================================
OK (no error)...................0
Fundamental error...............-1
Drive not ready.................-2
Unknown command.................-3
CRC error.......................-4
Bad request.....................-5
Seek error......................-6
Unknown media...................-7
Sector not found................-8

Invalid function number........-32............1
File not found..................-33............2
Path not found..................-34............3
No handles left.................-35............4
Access denied...................-36............5
Invalid handle..................-37............6
Insufficient memory.............-39............8
Invalid memory block address...-40............9
Invalid drive specified........-46...........15

No more files...................-49...........18
Range error.....................-64...........33
Internal error..................-65...........34
Invalid program load format....-66...........35
```

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

PAINT
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

GDOS
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and
more)" by Douglas N. Wheeler from the atari.archive server. The file is
/atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server.
The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files
or font files (at least those supplied by Atari). You can get these files
with many commercial programs, such as Degas Elite, WordUp!, etc. You might
also want to check your local user group to see if they received a copy of the
WordFlair demo program (also available on GEnie). The demo program appears to
have the GDOS system and font files.

TEX
Is TeX/LaTeX available on the Atari ST?
=====================================

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.0) has recently been made available on the
atari.archive server. The files may be distinguished from the other TeX/LaTeX
files in the /atari/tex directory by their date (posted in December 1990) and
by the fact that they are all archived using LHArc (.LZH suffix).

LANG
Public Domain/Shareware languages...
====================================

Check the atari.archive server under /atari/languages. Currently included:

abc recently posted to comp.binaries.atari.st
apl demo version
forth Don't know which one. I recommend Bradley FORTH
icon
modula-2 From Germany
Sozobon C Most excellant
Elan
xlisp
xprolog
xscheme

GNUC
Is GNU C available on the Atari ST?
==================================

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems.
For more than minor programming, you may need to upgrade to 2 or more
megabytes, as the GNU programs generally assume you've got plenty memory.

GNU C for TOS is available via anonymous FTP on atari.archive. It is also
available via anonymous FTP on cs.uni-sb.de [134.96.7.254]

DEV
How do I become a developer for the Atari ST?
===

Contact Gail Johnson, Atari Rep Person, (408)745-2568

Gail can explain the program to you, and send an information packet if you so desire.

A recent file posted on GEnie, title DEVPRG.TXT, mentions a 2-tier developer membership. The 'higher quality' developer support goes to commercial developers, and would cost $250. The 'no-hand-holding, no announcement of company future products, no access to discounted hardware) would go to noncommercial developers, at an initial cost of $125, plus $50 renewal fee each year.

Both tiers would receive the ST/TT Developer Kit and all developers have to fill in an application form and a non-disclosure agreement. Contact Gail for more information.

ZNET
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

ZNET and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

PALS
ST Pen Pals list
==========

Simon Chappell is compiling a list of people interested in exchanging paper-based mail "of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

TIPS
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

1779. US ST mags (was Re: ST mags from abroad)

Newsgroup: comp.sys.atari.st
Date: 1991-02-18 02:33:52 UTC
From: seitz@netcom.COM
Message-ID: <24463@netcom.COM>
Source record: 234324

Just before last Christmas, on a whim, I subscribed to just about every U.S. ST Magazine. Except STart: I don't think the disk is worth the cost. I did subscribe to ATARI EXPLORER, ATARI INTERFACE, CURRENT NOTES, ST JOURNAL, ST WORLD, and ST INFORMER.

So far I've received two copies of ST INFORMER and one of ST WORLD. The 2 issues of ST INFORMER have been excellent. Lots of new product announcements, advertisements (a plus in my opinion), Atari News, and Product Reviews. The issue of ST WORLD was a big disappointment. Usually, this magazine has all the same good features I mentioned for ST INFORMER. Not this time.

All the new product announcements were games. There was no Atari News. Dave Small's excellent column was missing. There were only two articles on applications or utilities for general ST users. Of these, one was on CodeHead's MultiDesk and HotWire and MultiFile, all of which have been reviewed many times in the past in other magazines. 25% of the articles were on Lynx games, which are useless to ST owners. All in all, a big disappointment.

So far, ST INFORMER has been by far the best buy.

1781. Atari computers for sale!

Newsgroup: comp.sys.atari.st
Date: 1991-02-18 05:17:27 UTC
From: chuck@umbc5.umbc.edu
Message-ID: <5052@umbc3.UMBC.EDU>
Source record: 234329
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

I have two 520ST CPU units for sale:

Unit 1 has 2.5 megs (Z-RAM upgrade) $280
Unit 2 has 1 meg (Piggyback RAM) $190

Units include mouse and power supply, and also have RF modulators built-in.
NOTE: These units do not include disk drives.

These prices are ASKING prices. If you want to haggle, go ahead! I love
a good barter session. If you have some hardware to trade, go ahead and
offer that as well. I'm looking for Atari ST and IBM equipment at the
present time.

If you are interested, just drop me a line at my signature address or call
me at (301) 455-1506 for the personal touch.

Thanks!

Probably because the comp.{binaries,sources}.atari.st groups are only a fraction of what's available at atari.archive... For UK users who have JANET/PAD access, ftp is now available via nsf.sun at UCL, username and password are both "guestftp". This service is free to academic users (though I expect commercial sites will have to pay - isn't life fun in the ivory tower 8-).

Cheers,

Si Carling

I had no idea that there was a purely software PC emulator for the ST. I have an STe and would love such a facility - how much does it cost and is it unbearably slow?

Ivan Hoe

1787. Quick ST vs Turbo ST

Newsgroup: comp.sys.atari.st
Date: 1991-02-18 12:22:27 UTC
From: alanh@logitek.co.uk
Message-ID: <alanh.666879747@krypton>
Source record: 234372

Hi netters,

With all this talk about Turbo ST and Quick ST, I decided to put it to
the test on my machine. I have an Atari 520STFM upgraded to 2.5MB and TOS 1.0

I am using Quick ST V2.2D-(Demo Version) and Turbo ST V1.6D-(Demo
version).

I received these figures:-

Quick ST 2.2D Turbo ST 1.6D

Low Resolution

Tos Text 266% 454%
Tos String 452% 864%
Tos Scroll 176% 174%
Gem Dialog 158% 199%

Medium Rsolution

Tos Text 355% 361%
Tos String 1845% 1428%
Tos Scroll 178% 182%
Gem Dialog 231% 187%

High Resolution

Tos Text 335% 339%
Tos String 1311% 1270%
Tos Scroll 181% 186%
Gem Dialog 229% 212%

I would like to see what people get with a similar setup, but with both
commercial versions rather than the demos.

Alan Hourihane

1788. Neoodesk 3 bug with TOS 1.4 (repost)

Newsgroup: comp.sys.atari.st
Date: 1991-02-18 13:50:45 UTC
From: lhf@ukc.ac.uk
Message-ID: <3458@gos.ukc.ac.uk>
Source record: 234333

This is a re-post, since with the exception of someone asking me to post
the answer, I had no replies.

I have recently upgraded to TOS 1.4 and I am also a Neodesk 3
user. I seem to have come across a problem with this combination.

When in Lattice Cv5, I have to set up various environment variables
to show where the binaries/libs/headers etc are. This information is then
saved into a tool .inf file, which is then used once entering the compiler
the next time. However, whenever I enter Lattice, the said .inf file is
never re-read, hence the environment variables are empty.

If I execute Lattice from the normal Atari desktop, this problem
does not occur. The problem did not occur also with Neodesk with my old
TOS 1.2. Installing Lattice within Neodesk, to make sure the program has
its current working directory in the same place as the .inf file (namely,
the text or program path), does no solve the problem.

I can of course set up the environment variables within Neodesk.
Whilst this does work fine for Lattice, it causes problems for other programs
in use on my system.

Is there someone connected with Gribnif on the Net? Has this bug
been fixed, or is there some simple solution?

Thanks in advance for any help offered,

Lee.

>or something? The drive works fine as a double density...
>

You need to buy a 1.44 meg disk controller board such as the one available
from DreamPark Development (the PowerDrive). The ST's floppy disk controller
WD1772 cannot handle high density format. Diamond Format, which is a
formatter distributed to the public and with Diamond Back II, was specifically
modified to format high density drives like the PowerDrive. Diamond Back II
also fully supports 1.44 meg drives in all program functions.

I would imagine that Motif can be used on monochrome unix systems,
so low res would not be required, just design the widgets properly.
I have seen Motif on a gray-scale monitor, but that is different.

On another line a thought, I was wondering if it would be possible
to inherently spruce up GEM. Most people would admit that GEM looks
pretty lame next to Motif, even though GEM is okay to use.

I was wondering if it would be possible for any guru types to write
a TSR that would catch GEM object draws and replace them with new
object draws that looked like Motif. Mind you, that this would
not add any new functionality to GEM, it would just make the standard
GEM objects look like a Motif object. I know that Slicctop catches
alert boxes and can substitute its own in, so how hard would it be
to catch everything?

I know nothing about this so don't get too upset :)

Just wondering...

|>

OK, mea culpa. This is the last piece of the jigsaw puzzle I needed.
I had heard that the TT was one version behind, which now turns out to be
V.3, and not V.4. When I read the article, and read V.4, I assumed that
this was still the case. I had expected a higher number, since the local
SysOp has a higher number (and says UNIX on the same line -- what a mess),
and the notoriously goofy numbering of UNIX itself. (And, of course, Atari's
history, recent and past, but that is neither here nor there.) So perhaps
Atari is, if not ahead of the curve, then at least not slipping into the
computer Cenezoic Era. However, I reserve the right to air any future
complaints, lest the squeaky gear not get the oil... :-)

>
> Consider this a plea for help...

There is a path to follow. Something like this:

```
::::::::::::::
: :.............
: :. .
-- :. --
| | - exit :. | | - enter here,
-- :. -- follow (.)
:. to gem
:.
:.
o - get the gem,
follow (:) to exit
```

Basically, the vertical (.) to the gem and the vertical (:) away from
the gem are the same line. Just stay away from the spikes that going
around the room. And of course, the room is diagnal in the game...

Well, it worked for me!

>Other implementations out there for other machines don't shine so
>brightly. (I won't name names in the interest of not throwing spoilt
>apples at other companies, but...) Have you ever used a presumably
>fast machine that used cooperative multitasking? The 40% overhead figure
>that I mentioned above would not seem unrealistic to you after using one.

A consultant doing a study for a customer of ours did some research into
the amount of overhead our operating system (OS-9) required; his findings
were that on a 20 MHz 68020 the the OS required less than 0.5% of the CPU's
processing bandwidth, using a 10 ms clock tick, 2 ticks/slice (which equals
50 time slices/second). This overhead consisted primarily of the scheduler
aging processes and saving context/switching process where appropriate.
This was not on an ST, so OS tasks such as mouse handling weren't needed.
A 68030 should require substantially less overhead, since as the processor
power goes up the relative amount of time needed to do housekeeping goes
down. Also, the on-board cache of a 68030 should make a substantial
difference. Of course, the same holds true in the other direction - a 68000
would require substantially more overhead as a percentage of total processing
bandwidth. Also, OS-9 is a real-time operating system, and so is tuned to
require as little overhead as possible. More general-purpose OS' such as
TOS (were it multi-tasking), Amiga OS, Mac System 7.0, and Unix generally
would require significantly more overhead (a factor of 10 wouldn't be an
unreasonable assumption, at least for Unix).

On the other hand, I suspect the cloned Mac ROMs will be the 256K ROMs, which both Spectre and the ST cartridge port are currently unable to deal with...I too, however, hope a reasonable solution will present itself to keep Gadgets viable.

When ST World (the Oregon based newspaper) started, they were excellent,
because they had the straight stuff long before everyone else had it.

Now for some reason, they have lost that advantage. Their proofreading
has always been miserable, and a couple of columns just never did hold up.
But now, I agree, they have really hit bottom.

Source record: 234349
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.st.tech

Perhaps someone can answer these questions about Darek Mihocka's (Hope I got the spelling right...) 8-bit emulator Xformer?

1) What are the pinouts for the Xformer cable (to hook up the 8-bit's drive)?

2) How does Xformer handle input from the joysticks? Are all 4 of the 8 bit's joysticks supported? Are only two? Do they plug into the ST's Mouse and joystick port? How about the "Paddles"?

3) How well does it do with disk based copy protected games? Does the "virtual floppy support" (files on hard disk) support disk based copy protection?

4) How fast is it compared to a normal 8-bit?

5) Could someone post the source code for Xformer 2.55 to terminator (Darek said it's now PD and is on Genie, but I don't have an account there. Has it made it to Compu$erve, or anywhere else I can get it?

6) Has anyone tried M.U.L.E. or Seven Cities of Gold on it yet? If so, how did they work?

Thanks for any help,
---jb (jfbruno@rodan.acs.syr.edu)

Thanks for the kind words. Low overhead was definitely one of my goals for MiNT, and I think it turned out not too bad (I get about 1 or 2% fewer dhrystones under MiNT than under TOS, which isn't noticeable to the user).

> Could it be possible that MiNT implements a rewrite and speedup of
> the Bconxxx O/S calls, and that's why typing and printing text

> actually FASTER under MiNT?
>
No, not yet. In fact, the overhead for system calls under MiNT is quite a bit higher than under TOS, so Bconxxx calls are a lot slower. However, it's possible that the Cconws() and Fwrite() may be faster, so it probably balances out.

I believe it is compatible with Turbo C (the compiler that Neodesk is presently done with). Gribnif sells 4 different Turbo C packages, but I can't remember the prices off-hand. If you are looking to get into C programming, Turbo C is the way to go (in my opinion).

Speaking of Gribnif (or more precisely Dan Wilga), I just downloaded a a new Colaware product of his called Formdoit. If you can find it, download it. My site doesn't have FTP access yet, but I'm asking (grovelling, pleading, and begging) the sysop here to get access. Read the next msg. with regards to the features of Formdoit.

```
FormDoIt! version 1.0
by Dan Wilga
Copyright = 1991, Gribnif Software. All Rights reserved.

This program may be distributed freely, provided that this text file is
present
and that it and the program file are unmodified.

This program replaces one part of GEM that has always been in need of
improvement: the dialog manager, sometimes known as form_do(). This is
the part
of GEM that handles the boxes that appear in most programs in order to
ask for
options or settings. FormDoIt adds a number of features to this
all-important
aspect of the operating system. It is loosely based upon a program that
appeared as part of the Professional GEM Series, by Tim Oren.

Installation:
------------

FORMDOIT.PRG may be copied to the AUTO folder or run directly from the
desktop
of your choice.

Editable Fields
---------------

An editable field is a string within a dialog box that has a vertical
line
cursor so that you can modify it with the keyboard. FormDoIt emulates the
normal GEM dialog functions:

o The Tab and down-arrow keys move to the next editable field.
o The up-arrow key moves to the previous editable field.
o The left- and right-arrow keys move within a field.
o The Esc key clears an editable field.
o Backspace and Delete delete characters before and after the cursor.
o The mouse can be used to select an editable field for the cursor.

It also adds a number of extensions:

o Tab and down-arrow will move the cursor to the first editable field
in a
dialog box if it is already at the last one.
o Up-arrow will also wrap, from the first field to the last.
o Shift-left-arrow will move the cursor to the leftmost character in
```

the
field, and Shift-right-arrow will move all the way to the right.
o If a dialog box does not have a "default" button (of the type that
gets
selected if the Return key is pressed), then the Return key will
automatically advance the cursor to the next editable field.
o The mouse will position the cursor to the character closest to where
the
mouse button is pressed, not just to the end of the line.
o There are two ways that any character in the ST's character set can
be
entered:
1. Press the Insert key. This opens a box that contains the entire
character set. Click with the mouse on the character to use. You
can
click anywhere outside the box or press a key to remove the box
if you
decide not to use it.
2. If you know the ASCII value of a particular character, you can
hold
down the Alternate key and type it, in decimal, using the
keypad. A
character is generated as soon as the Alternate key is no longer
being
held down, or three digits have been pressed. For example, to
enter an
"A" (ASCII 65), you would do the following:
Hold down the Alternate key
Press 6 on the keypad
Press 5 on the keypad
Release the Alternate key
Please note that not every character is valid for all editable
strings;
Just as certain keypresses may be ignored because they are not the
right
type, characters selected with either of these two methods may also
be
ignored.
o If you have TOS 1.0, you may have run into the "underscore bug"
before;
typing an underscore ("_") character with certain types of editable
fields
can cause GEM to crash. FormDoIt will prevent this crash from
happening, if
you type an underscore by accident, but the only way it can do this
is by
ignoring the character, so you won't see it appear.

Buttons:

Normally if you press Return in a GEM dialog, the "default" exit button is
selected. This button can usually be identified by the fact that it has a
very thick border.

FormDoIt also adds a way to select the most common type of button that is not
normally the default, that is, the "Cancel" button. If you press the Undo
key, then the dialog will be searched for a string that is either "Cancel",
"Quit", "Exit", or "Abort". If it finds one, then the button is selected.

Probably the most valuable feature that FormDoIt provides is keyboard
equivalents for buttons other than the defaults in dialogs. When it takes
control, FormDoIt scans all of the buttons in the dialog box and assigns
keyboard equivalents in such a way that each button has a unique one. When the
dialog box appears, it will look different because there will be short lines
underneath characters in most of the buttons. If you hold down the Alternate
key and press the character that is underlined, the button will be selected.
Up to 20 buttons in a dialog can have Alternate key assignments.

Alert Boxes:

FormDoIt also affects the way alert boxes work; these are the pre-made GEM
dialogs that usually have a Stop sign, a question mark, or an exclamation
point icon in them. In addition to providing keyboard equivalents for the
buttons in alerts, FormDoIt will also let you redefine what the icons in
the alerts look like.

If a file called FORMDOIT.BL3 is in the same directory as FORMDOIT.PRG when
it runs, then the icons contained in this file are used in place of the

default ones in FormDoIt. Included with this program are three files:
BORING.BL3, DEFAULT.BL3, and INVERSE.BL3. The first contains the normal GEM
alert icons, the second has the default icons that will be used if there
is no file called FORMDOIT.BL3 (kind of redundant), and the third has

yet
another set of icons in it. To use one of these files, simply rename it
to
FORMDOIT.BL3 and run FORMDOIT.PRG.

The icon files are in Degas Elite block fomat. They can be edited and
re-saved using Degas, but if you do edit them you must be very careful
to
make sure that the new file you save is a block that is exactly 32 x
96.
The "Snap" feature in Degas is helpful for this purpose.

Disabling FormDoIt:

If, for some bizarre reason or other, you would like to temporarily
disable
FormDoIt, you can do so by holding down both Shift keys and pressing
the
Delete key. To turn FormDoIt back on, press the same keys again. Both
of
these actions will cause a short sound effect.

Compatibility:

While every effort has been made to assure that this program works with
other
programs, there are a few things worth mentioning:

Some programs use their own dialog manager and therefore will not
benefit from
FormDoIt at all. Some examples of this are Tempus II, K Resource, and
two
programs which only use their own dialogs part of the time, Aladdin and
Superbase. The GEM desktop will also not be affected by FormDoIt
because it
calls the dialog manager internally and there is no way for this to be
intercepted in such a way as to work with all ROM versions. The system
also
has several "canned" error messages that will not be affected by
FormDoIt
for the same reason, such as "Please insert disk B into drive A:" and
"Data on this disk may be damaged."

FormDoIt will work with the Universal Item Selector, with the exception
that
UIS' own keyboard equivalents prevent the Undo feature of FormDoIt from
working.

While FormDoIt does work with CodeKeys from CodeHead Software, any
mouse
button presses that occur while FormDoIt is handling a dialog box will

not be
recorded by CodeKeys. A macro which has been recorded without FormDoIt
active
can, however, be played back when FormDoIt is active, and it should
work as
expected. See "Disabling FormDoIt."

FormDoIt has more strict error checking for alerts than GEM does.
Consequently, you may find one or two programs which use more than 30
characters per line in the alert text or more than 10 characters in a
button. For these, FormDoIt will chopped-off the remainder (unlike GEM,
which can produce some very odd-looking alerts!)

The one bug I know of relates to programs which call form_do() once
and,
depending on which button is pressed, change the contents of one or
more
of the buttons in the dialog and then call form_do() again. This can
cause
the keyboard equivalent underlines to appear under more than one
character
in the same button, though it just means that the ones from the first
call
were not removed. I could prevent this by always undrawing the
underlines,
but this is such a rare case that the slowdown is really not worth it.

About "Colaware":

You've heard of public domain, you've heard of shareware. This program,
however, is Colaware: if you like it, you are encouraged to send
copious
quantities of highly caffeinated beverages (Coke, Jolt, etc.) to the
address below (via U.S. Mail, please; UPS won't deliver to a P.O. Box)
so that I can continue to create more products like this one.

Source record: 234352

mlake@irscscm.UUCP (Marshall Lake) writes:

- I understand the 520STe comes with 1 meg of RAM. Is this correct? Can
- someone please show the differences between the 520STe and the
- 1040STe. I had heard that the STe didn't always work properly with a
- HD. Has this been corrected? If so, what should I look for to ensure
- I obtain the latest version of the STe? Is there anything else to
- consider in purchasing an STe?

My understanding was that the 520STe comes with only 512K in a
configuration of 2 256K SIMMs; moreover, it is only sold in Europe,
not the US. Also, the 1040STe has 1meg with 4 256K SIMMs.

The hard drive problem is over. It has been for several months.

What to look for in a new STe: perhaps TOS 1.62. But I wouldn't
worry about it. The desktop bug in TOS 1.6 is not a problem and I
don't use STE_FIX.PRG. I don't know what else they fixed. Allan
Pratt or Dave Hanna, can you tell us what's fixed in 1.62 and if it's
shipping in new STes.

thaanuj@mist.cs.orst.edu (John Thaanum) writes:

- I used to have my computer set up on an ugly, home-brew plywood and
- 2x4 desk. Using the mouse on such a surface was jumpy and inaccurate.
- I bought a mouse pad a couple of months ago, and I love the feel.
- However, my mouse (plain old atari model) gets dirty much quicker, and
- the problem seems to be getting worse. When I first got the pad, the
- mouse needed cleaning about once a month, but now it gets really
- gunked up after only a couple of weeks. Within days there is
- noticeable buildup on the rollers.

I think Atari has designed a new mouse and is shipping it with the new computers. I got a very nice Atari mouse when I got my STe; it was nothing like the mouse I got with my 1987 vintage 1040. It's much smoother and doesn't get as dirty. Since I've had it (September 1990) I've only cleaned it once or twice. I still have a cloth mouse pad that I bought at a computer swap in the SF Bay Area when I got my 1040. It's wearing through, but I don't think I'll get a new one until I can see through this one. :^) Theoretically, the pads with the cloth covers work better than the plastic-covered ones because the cloth ones collect the dust and prevent it from getting in the mouse. You can also throw the cloth mouse pad in the wash and get it cleaned; I've done this a few times before and now it's ready for another go-round!

- What surfaces have you found to be comfortable yet sanitary for
- operating a mouse on?

I think basically anything works fine though. Any smooth, clean, well-kept surface should work fine. BTW, someone told me that the cloth mouse pads are cut from the material that they make scuba diving suits from. It certainly seems like it.

Whoa! The Motif interface is not X! It's a user interface standard -- a
``look and feel.'' It's just a legal dodge to avoid Apple's lawyers.
Implementing Motif doesn't require adhering to the programming strategies
used on Unix workstations.

Geoworks Ensemble licensed Motif for its windowing system and related
applications designed for the 8088-era Intel-based PC clones. From all
accounts it's small, fast, and what PC GEM should have been.

I tried to mail you, but it bounced 8-(

I suppose it 's a pretty general (if it seems relatively unrecognised)
problem, so the reply is posted below...

>From: hvaalde@cs.vu.nl
>In comp.sys.atari.st you write:

>> When in Lattice Cv5, I have to set up various environment variables
>>to show where the binaries/libs/headers etc are. This information is then

>Sounds like lattice can't find the file because the program directory is not
>the default path anymore.
>PATH=;C:\;<lattice path>;<other paths with programs searching tool files>

>Another aproach would be to specify lattice C as a Application in
>Neodesk and specify that the default directory at startup should be the folder
>Hope this helps,
>Harold van Aalderen (hvaalde@cs.vu.nl)

Thanks for the reply.

Alas, I think I have tried both of your suggestions. The environment
variables from the desktop are empty I assume, yet it works okay from here.
Lattice usually looks at its cwd for the tool file, but I have installed it
as an application and made it look at the data file directory, but in both
cases it just will not load any tool data held there within.

By setting the variables in Neodesk works, in that Lattice then
inherits these. It doesn't seem to look at PATH to find where the data file
is, instead I assume it is supposed to look at its cwd. So it generally means
I have to keep variables set within Neodesk for inheritance into Lattice,
which I have to then remove when it mucks up certain other programs.

Anyway thanks. I'm pretty convinced that it is a Neodesk3/TOS1.4
bug at the moment, and I've yet to hear otherwise unfortunately.

Thanx,

Lee.

The database is still there. You can use mail to contact the bitftp
connection at pucc. An announcement about this appeared here recently.

The ideas is this: You send mail to the server at Princeton. It
does the ftp access for you. It then encodes the date in one
of two formats, either UUENCODE or NETDATA, and mails it to you.

Trouble is, plenty of useful stuff didn't get posted on c.b.a.s., or much more recent versions are present on atari.archive@umich. I hope it is possible to resolve the security issue soon so that people with mail-only access are not cut off forever. BitFTP is at best a temporary solution IMHO. Surely it can't be too difficult to rig up a "hacker-proof" mailer quota system. Here's cheers and appreciation for the ST-archivers at umich for providing such matchless and useful service, "probably the best in the world".

HI,

Has anyone bought a 1.44Meg upgrade from a company called data deicke
in Germany.

I got it from Third Coast Technologies in the UK, but I don't have an
English manual for it.

There are 8 pins to wire up, +5v , GND, pin 20 soundchip, pin 19 sound-
chip, pin 18 of WD1772, 32Mhz signal from pin2 of SHIFTER, and 2 HD-select
signals.

I would just like to know the wire to the WD1772, do I solder this
directly onto the chip, or do I have to break it from the motherboard.

Any other details regarding this HD-Module would be much appreciated.

> I also got 416x280 and 832x280 in color modes on the multisync.
>
> So what's it take to get more vertical rez in color - interlace?

Actually, I designed a little (< $5) hardware hack a couple of years ago which added an interlace mode to the ST. It was interesting to see a flicker mode on an ST, anyway this $5 hack gave 320*400 640*400 640*800 interlaced modes to your ST. Actually mono mode (640*800) was actually watchable 'cause of the 72 Hz V scan rate. Add to that overscan and I guess 736*960 is possible :-)

This actually was just a gizmo that plugged in into the monitor port between the ST and your monitor and consisted of two ICs a 74ls74 and a 74ls122 I think , The object is to delay the vertical sync pulse by half a line relative to the horizontal sync pulse on every odd, given there was some way to detect which field was which (GPO) one could flip screens each field to generate high rez displays.

It turned out that I just could not stand the flicker, so the board is an unusual curiosity in the bottom of a junk box somewhere.

PC-Ditto I is a software emulation of an IBM PC. I use it on a 1040.
Whether or not it is"unbearably" slow depends on the application. If the
application is compute intensive (such as graphic printing calculations)
it is extremely slow. However, I use Quicken 4.0 regularly and the
speed is a little slow but perfectly acceptable. I have even run
SuperProject Expert and Advanced Project Workbench. These are slow and
if one were to use them frequently, it would drive one nuts. However,
for the quick odd update, it is fine.

I'm open to any suggestions on how to do an automatic "hacker-proof" quota system. The version I'm testing now closes the hole that was used, but I still know of many easy ways to fool the quota system and no easy way to prevent it.

While you're thinking of an automatic system to suggest, keep a few things in mind:
- we don't have the administrative time to deal with pseudo-accounts
- we can't assume that account names are unique on the internet
- there are many, many twisted ways to write valid addresses
- some networks use user@host.domain instead of user@domain
- some systems let users change their mail names independent of acct name

When booting with TOS 1.4, if you wish to boot from floppy you should wait until the floppy light comes on the _second_ time before pressing ALT+SHIFT+CONTROL. That is, the floppy light will come on (briefly, if a formatted floppy is inserted), go out, then come back on. Don't press ALT+SHIFT+CONTROL until the second time the light comes on. Works 100% for me....

PC Ditto I is SLOW. But for < $79 its also cheap.
While the Norton rating was like 0.2, it works very well.

Three examples:

1. My wife took a course on using MultiMate. She had no problem running
it on PC-Ditto. Data entry is no problem; the typing interface
keeps up nicely. However, she learned quickly to not use the spell
checker -- its so cycle intensive it never finished a document before
she gave up on it.

2. I hacked PC-Ditto to interface to the Atari CD-ROM. I have no problem
extracting files using the MS/DOS programs that are needed to
do that. Its not fast, but it works.

3. Several times I've run the Norton utilities to recover files that I had
inadvertently removed under TOS. Works great.

Unfortunately, the producer of PC-Ditto is out of business, but you may find
copies still for sale new. And Used.

> 15 tracks).

I played with the "demo" version of Tiger Cub that came with a recent START issue. One obstacle that I encountered was that there was no "MIDI Thru" feature to echo MIDI IN to MIDI OUT. Somebody who knows for sure should probably confirm that this feature is in fact missing. It's quite indispensible if you have more than one keyboard.

>part of the archive. Any chance they can be uploaded too?

You're quite welcome. I did notice that the .img's weren't in the
archive. They just 'went away' when I put them on my sparcstation.
I'll try to get them up this week - perhaps with postscript versions
so you can print them that way too :-)

For everyone who has asked where the upload is, it's on:

atari.archive.umich.edu:atari/programming, filename: arp68k-book.tar

It's a 600k+ tar file of compressed text and src code...

The .img files will end up there as well, but look for them in newitems
by next week (hopefully).

Enjoy,

Joe

This is documented (in the book I checked) as "must be (WORD) 0." However, it's probably seen as "unused" by somebody out there, and thus should not be toyed with likely. To make start using this arg to mean something is probably a mistake. When you ask this kind of thing, you might get more informative answers if you let on what you had in mind, rather than just asking your question.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have noticed at the beginning of an executable program file that there is a branch into the main program, followed by a
few numbers, followed by the main object file. What are these numbers? I have used the compiler supplied with STOS to write some
small routines for use in STOS; I would also like to use these outside it. These do not have the header that executable files have.
What info should I put before them to make them executable?
Also: could somebody give me a list of commands for directly turning on the Disk Drive, moving the head to a sector, reading
and writing a block to a sector, formatting a sector etc. I know the addresses $FF86xx are involved in this, but I'm not sure how.

Any info on both of the above would be appreciated.

I haven't been following this thread very closely because I didn't use BART. But as I understand it, someone dowloaded more than his fair share, which caused too much of a strain on the system, and caused someone in administration to shut it down. Why not just put an upper limit on the amount of resources BART is allowed to use? Like, only allow it to send 10 files an hour, or perhaps run it at a really low priority, or something like that. Then if some idiot _does_ break security and grab hundreds of megs of stuff with one request, the worst that can happen is everyone else has to wait a few hours (or perhaps days) and then get their files. This would probably require some tuning to prevent too much backlog, but it certainly would prevent an irresponsible user from getting the system shut down again.

Hello,

I have read about someone who was wrongly accused of downloading
too much at one time. It had to do with a gateway being down for a few
days, and that requests were queued up until the gateway was up.

When the gateway was brought up, it saturated the terminator with
requests.

I thought this had been solved, but I get nothing when sending
to the terminator...

I knew what the code does, but I simply don't like it... :-)

> The way in which it is done may seem like a dirty hack to you, but
> think of what the possibilities are:

(Explaining pro's and con's of this method and the other way of intro-
ducing a new GEMDOS call)

Well, I *think* there's a method to set the media change state via a
Rwabs() call with strange parameters. At the moment I'm not quite sure
whether this is just a hack in some hard disk drivers or it's a function
supported by the standard bios routines. Does someone know more 'bout it?

> I don't know what you mean about writing device drivers "on GEMDOS
> level". Device drivers are the lower-level things that Gemdos calls
> in order to move data to and from a device.

(explanations about device drivers follow here)

Yes, I know that. But there are some things that cannot be done on
bios level. For example, if you want to set up a central file server for
serveral machines, you *must* link your own routines into the GEMDOS trap.
And if you write these routines you're quite astonished when everything
works except the <Esc> redraw routine on the desktop... The problem was
that the Desktop waited for a call of Getbpb() during the evaluation
of the Fopen("<drv>:\\x",0) call. And this confused us a little bit...

> I think your complaint is simply that Gemdos operates a little
> differently than you had thought.

Yes ... a little bit ... it's really astonishing that such little problems
need weeks of debugging while greater tasks like Pexec() and the pool
manager are done in a week-end or so.

(about the logic of calling Getbpb() during the Fopen()-call when having forced the media change state to 2)

> Doesn't seem that unreasonable, when you
> think about it.

Yes ... but I don't think that an application should *expect* this behaviour. Furthermore, we didn't expect such reactions from the DeskTop since all the other functions of this built-in application are on the gemdos level or higher. There is no call of bios in it, so I think this is stylistically not very nice.

> I don't think this is a reason to flame.

I was just very surprised and a little bit angry, because these little "gags" make the implementation of file-system-oriented device quite problematic. We were happy enough when we completed our new GEMDOS trap handler and hoped that the largest problems were solved.

> automatically advance the cursor to the next editable field.

It is funny, I just spent all weekend writing code for a form_do that these type of features. Of course my code did not have all the features mentioned here, nor was it an autoprogram, it was just intended for me to link in with my programs.

The features I added:

o Up/Down/Tab keys all wrap around, no more stopping at the top or bottom.
o The RETURN key will always advance you to the next field unless you are at the last field then it will exit the dialog box. Very convenient for entering text into forms.
o The ENTER key will exit you like the normal RETURN key.
o And the real clincher for the program I am working on, the form_do will also look at the serial port to see if anything is there, and if there is anything, it will enter it into the current text field as if it were typed from the keyboard.

I wrote it in Lattice C v.5 and it seems to work pretty good for my programming purposes.

Yup, my LaserJet3 has a 68000 in it (10MHz in it.) In fact many laser
printer controller boards are running a 680x0. Think of all the Apple
LaserWriters out there too. There are probably many Sega Genesi (proper
plural?) out there by now and many arcade machines are running off
the friendly 68000. Just a couple other areas that the 68Ks are in.

1854. 1040 ST for sale

Newsgroup: comp.sys.atari.st
Date: 1991-02-19 22:28:16 UTC
From: jharres@sleepy.bmd.trw.com
Message-ID: <1193.27c14410@sleepy.bmd.trw.com>
Source record: 234270
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

I have a 1040 ST for sale. It includes the CPU (socketed), a ZTime internal clock (no guarantee on battery), mouse, and software and manuals that came with it originally. Worked fine the last time I turned it on. This does not include a monitor. $300 or best offer.

Jim Harres jharres@doc.bmd.trw.com or 801-625-8072 MDT

>problem remains.

Well, when you try to diff these files on a Unix box, you'll get that a
difference exists, but no indication of what the difference is. Even if you
specify "-w" to ignore whitespace; I guess Unix doesn't recognize CR as a
whitespace character. Whenever I've had this problem on a Unix box I just
delete all the CR characters. (BSD - tr -d '\015' <file1 >file2)

Since CR *is* whitespace for TOS, I'd just use the -w flag when diff'ing the
files and leave it at that.

I have a standard 1040ST-1meg-720kDD internal system. I have an Atari SC124 mono monitor and a Commodore 1702 color RGB monitor with the VIDEOKEY box which will also allow VCR hookup. I have some game disks and about 2 years worth of START magazines with disks, plus other Atari magazines. I'm asking $750 for all of this, but am more than willing to take lower offers. Please either drop me a note or call me at home at (317)447-6531.

I'm not Dave; I don't even play him on TV, but I can speculate.

I'll bet a lot of radiation escapes from all those ports Atari puts on all
their machines. Other companies can probably classify things like MIDI, and
even Centronics and RS-232 ports as optional add ons, and get the FCC
approval without them.

> reading (in STart I think) that, while 24 pin printers are much better at
> printing their internal fonts, 9 pin printers are better for graphics, which
> is really what you are doing when you use GDOS fonts. Can someone confirm
> or deny this?

Deny. The resolution of a 24-pin printer is simply better than that of a
8/9-pin. If your software doesn't know to to generate the bitmap for the
higher resolution, then your are stuck with the 24-pins 8-pin emulation mode,
which may indeed be somewhat worse than a true 8/9-pin.

GDOS does support different font resolutions for 8/9 and 24 pin printer, so
programs using GDOS fonts should indeed get better resolution with the 24 pin.
I *know* the music I print with Notator looks a lot better; it uses GDOS fonts
for chord symbols and a few other things.

> While a laser printer may be out of your budget, an HP Deskjet can be had for
> not much more than your nicer 24 pin printers.

Far be it from me to discourage someone from buying an HP product :-), but most
24-pin printers support a "hex density" mode in which the resolution is
technically a little better than a laser/Deskjet. Various factors conspire to
keep the output from actually looking better.

1859. Re: Quick ST vs Turbo ST

Newsgroup: comp.sys.atari.st
Date: 1991-02-19 23:59:31 UTC
From: ekrimen@ecst.csuchico.edu
Message-ID: <1991Feb19.235931.21308@ecst.csuchico.edu>
Source record: 234282

alanh@logitek.co.uk (Alan Hourihane) writes:

- With all this talk about Turbo ST and Quick ST, I decided
- to put it to the test on my machine. I have an Atari 520STFM upgraded
- to 2.5MB and TOS 1.0

Any TOS 1.0 machine would return the same results as a 2.5meg
520STFM; that is, with nothing installed. With memory resident
programs installed, you'd most likely get varied results.

- I am using Quick ST V2.2D-(Demo Version) and Turbo ST
- V1.6D-(Demo version).
-
- I received these figures:-
- [figures deleted for space considerations]

Unfortunately, this comparison doesn't tell us anything about either
program. The QuickST 2.2 Demo isn't running at full speed, for what
reason I don't know; how do you test a program, which is supposed to
speed up your computer considerably, with a demo that doesn't run at
full speed? Secondly, TurboST is up to something like 1.84, in which
case the TurboST1.6 Demo shouldn't even be allowed to line up on the
starting blocks. Moreover, the TurboST1.6 Demo runs at full speed,
but only runs for 15 minutes or so, if I remember correctly; IMHO,
this is a better way of distributing a demo.

- I would like to see what people get with a similar setup,
- but with both commercial versions rather than the demos.

I am also curious what people with the various versions of TOS get
with the actual programs. Maybe, since I have both, I should find
someone with TOS 1.0 and borrow their computer. Gee, what I have I
gotten myself into? :^)

Message-ID: <1991Feb20.004157.14406@jato.jpl.nasa.gov>
Source record: 234279

Does anybody know what signal is on pin 10 of the RF modulator in an old (rev B board) 520ST? It also appears on pin 2 of the monitor jack. I tried using it for Overscan, but it didn't work, so I assume it's not composite synch.

There's enough unused logic in my ST to compute composite synch without adding two diodes, a resistor and a transistor: U14 has a spare 2-input NAND, U40 has a spare 2-input NOR, and U35? has two spare invertors. That's ALMOST enough to control Overscan with GPO instead of a switch.

- meg?

To get 2.5meg with SIMMs on an ST/Mega, you need a JRI SIMM board (I don't know of anyone else who distributes them in the US, but there may be quite a few in Europe), 2 one-meg SIMMs, and 2 256K SIMMs. You cannot use 10 256K SIMMs and get 2.5meg because of the way things are designed. I would explain the reason to you, but I don't know it either. Just take my word for it. :^D

I just read in my newest Current Notes that Prospero is "toning down" their operations in the US. I am unsure how this would bother owners of these compilers, as the company is still going strong in Britain (where it is based). At worst, it would increase the cost of upgrades (postage to/from GB). I am going to purchase Prospero C with my next paycheck, I have seen it for $89.

I tried Gauntlet II on my machine, and it would not work correctly unless I disconnected my printer cable from the back of the machine (it would NOT work if I disconnected it from the printer!?!). The 4-player adaptor uses the printer port, and the game does not seem to like anything residing else residing there. My problem was that both a 3rd and 4th player would be created whenever I played, and one of them would try to walk to the left continuously.

I would like to note that the game is excellent, and I have played it as one of four (real) players. It's a blast! I just don't want to disconnect my printer cable whenever I want to play . . . .

I don't mean to ruffle your feathers or anything, but if YOU were the developer, I'd think they would answer some of your questions. You probably do work with a developer, but what's to stop me from calling Dev Support and say, "Hey, I work with Joe Gaudreau [for example] -- give me some info." Perhaps if you paid the $300, they'd listen to you. Unfortunately, this is the way it's gonna be, but Atari seems to be starting their two-tier development support system.

1871. Chaos Strikes Back -- walkthrough/help needed

Newsgroup: comp.sys.atari.st
Date: 1991-02-20 05:37:30 UTC
From: dhawk@well.sf.ca.us
Message-ID: <23245@well.sf.ca.us>
Source record: 234381
Cross-posted to: comp.sys.atari.st,rec.games.misc

We must expire articles too fast around here. I know this has been discussed, BUT I just started playing Chaos Strikes Back.

I'm stuck in a couple of different spots.

Diabolic Demon Whatever: what do you do? I've gone in several times, killed the rock-squids, cut through the flame pits and gone up and got what was on the upper room -- not much. Are you supposed to go in and kill all the demons in that room?

Priest path: There's a room that the flying lobsters appear in. Above it is a room with four little rooms with pressure plates and a closed door. There are two concealed pits and a button behind one of the pits. Does the button do anything? Can you get to it? How do you get the door open?

What is the 'Key of B' for? I've got about 6 of them and have found no place to use them. Got a lot of Iron Keys as well.

If anyone has any of the previous articles on Chaos, (and they're under 64K - this is a uucp connection) please email them to me. Thanks.

later, david

Yep, 680x0 chips ain't going away for a long time. The idea gave
me a chuckle, and this article brought to mind another example.

If your phone is connected to a Northern Telecom digital switch,
well, chances are that 68000's and 68030's are deciding how and
where your digital bits get through the switch. But that is not
the half of it. Those intercept messages, like "The number you
have dialed is not in service...", that is put together by no
less that an 8085. Not even an 8085 is obsolete yet.

1874. TT and developers package

Newsgroup: comp.sys.atari.st
Date: 1991-02-20 11:24:17 UTC
From: sm@tukki.jyu.fi
Message-ID: <1991Feb20.112417.16192@tukki.jyu.fi>
Source record: 234260

I haven't been very interested to do any software development with
my 1040ST, but now I am considerring to purchase a TT and would
appreciate info about developers package. How much there is TT info on
them ? How about TT hardware etc.
Thanks,
sm@tukki.juy.fi (Seismo Malm)

The download part of it is done already, complete with all of the
ZModem management options and creation of missing subdirectories.
Uploading still needs some work though.

My dealer vaguely described what he called "CALAMUS SL"..
SOmething to the effect of a "CALAMUS DESKTOP".. in whihc
you never have to "leave" CALAMUS... can do all your file
duties, run other programs and load "modules" that are
designed specifically for use with CALAMUS: spreadsheets for
example.

I heard mention of "SL" in an article from a EUROPEAN user.

CAN someone elaborate on this please.. correct me etc... and
does anyone know if and when SL will be available here? Is
it already?

Thanks
kevin

1884. SH204 Hard Drive problem

Newsgroup: comp.sys.atari.st
Date: 1991-02-20 18:12:42 UTC
From: scoile@gmuvax2.gmu.edu
Message-ID: <3528@gmuvax2.gmu.edu>
Source record: 234398
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I recently acquired a used Atari, SH204 hard drive, which I'm having problems with. I was wondering if anyone has had similar problems, or perhaps if anyone knows right off what may be causing the problem.

Occasionally, uppon boot-up, my SH205 will not recognize the 204 (the SH205 is physical unit 0, the SH204 unit 1). I normally give unit 0 a good head start on power-up (until the busy light flashes), and wait a good amount of time (10-15 seconds) for the 204 to get up to speed. Still, sometimes the 204 isn't recognized.

Next, (again, occasionally) the SH204 will spontaniously fail. It will just all-of-a-sudden, out of the blue, stop working. TOS can't access it (and yes, it IS still on...sheesh! :)

Any help will be greatly appreciated. Specs below:

Atari 1040STF
1 megabyte of memory (standard)
TOS version 1.0
Atari SH205 hard drive (unit 0)
Atari SH204 hard drive (unit 1)
AHDI 3.01

Does the STe allow more colors on the screen at one time or does
it just have a larger pallette?

Thanks in advance.

1887. help porting software

Newsgroup: comp.sys.atari.st
Date: 1991-02-20 20:42:22 UTC
From: scott@bbxsda.UUCP
Message-ID: <1732@bbxsda.UUCP>
Source record: 234400

A friend of mine who owns an Atari ST has expressed an interest in some midi software I wrote. My software was written for a Yamaha C1 (286 PC, MS-DOS) but the hardware/OS-specific routines are small, isolated, and relatively unassuming. Although it seems to me that porting my software should be rather easy, I admittedly know *nothing* about the ST. I basically need to do the following things (I'm not even sure if these are all possible on the ST):

Full buffered, interrupt driven midi-out
Arrange for midi-in interrrupt to call my C routine
Arrange for timer interrupt to call my C routine
set the timer interval (hopefully to resolutions less than 1ms).
simple screen output - put a charater at position x,y, set an attribute
simple keyboard input - single character read with no wait

I've looked through some hardware manuals and I really didn't find what I wanted to know. If anyone out there can point me in the right direction I would appreciate it. (If you happen to live in Albuquerque, call me on the phone).

Also, I noticed Turbo C mentioned in a couple posts in this newsgroup. I wasn't aware that Borland offered Turbo C on the Atari ST. Is this true? If it offers much of the same support library as it does on DOS that would help quite a bit.

>.... I
>basically need to do the following things (I'm not even sure if these
>are all possible on the ST):
>
> Full buffered, interrupt driven midi-out

Midi In is interrupt driven and buffered, midi-out is not. There are
BIOS calls for read/write in/out status. I guess they didn't make
output buffered since it would make precise timing somewhat difficult.
If you're capable in assembler it should not be all that difficult to
write your own.

> Arrange for midi-in interrrupt to call my C routine

That's fairly easy, there's a system call which lets you change the
'midivec' and have your routine called automatically.

> Arrange for timer interrupt to call my C routine
> set the timer interval (hopefully to resolutions less than 1ms).

No problem also, there are some unused timers in the system, you just
have to figure out which one you're going to use. If all you want
though is time stamps, the system has a 200Hz timer and a counter in
low memory that you can read yourself.

> simple screen output - put a charater at position x,y, set an attribute

The BIOS has support for a superset of the VT52 escape sequences.
Nothing fancy, but adequate for character-based applications.

> simple keyboard input - single character read with no wait

You've got 2 choices - BIOS level and GEMDOS level. At the GEMDOS
level you're actually reading from stdin, so it could be redirected.
The BIOS level can't be redirected.

>Also, I noticed Turbo C mentioned in a couple posts in this newsgroup.
>I wasn't aware that Borland offered Turbo C on the Atari ST. Is this
>true? If it offers much of the same support library as it does on DOS
>that would help quite a bit.

Borland in Germany sells an excellent TC package. Gribnif is
importing it and selling it here in North America. For somewhere
around ?$250-$300? you can get the full package: Turbo C (ANSI), the
Assembler, and the Debugger. It has a very nice GEM-based
multi-window development environment. All of the documentation and
on-line help is in German, but the menus, compiler errors, etc. is all

in English. If you know what you're doing in C / GEM you can get by. You'll probably want to get some other set of English docs for the TOS info such as the Atari Developer's kit or some 3rd party books.

The debugger only works in mono (it *does* work on large-screen mono monitors though) but it is wonderful. Also included is a BGI library (Borland Graphics Interface) that appears to be identical to its DOS counterpart.

I don't have a phone number for Gribnif... if you're interested your ST friend can probably find it for you.

ddd used our design published in a German computer mag, which leads me
to think you will have to break pin 18. It's the clock input from
the motherboard, and the HD module works by replacing the standard
8 MHz input with a switchable 8/16 MHz input.

This method only works reliably with drive A and B, and it is
undocumented. The method you discovered in Desktop's code is
documented and works on any drive. It's tricky, but not dirty.

>Yes, I know that. But there are some things that cannot be done on

Sorry...just a pallette increase....

but even Atari seems to be violating the 16 colour limit in low rez.
Check out the Jungle demo from Atari France, full 4096 pallette is used
as the sky...impressive!

Just last night (Feb25) I was on GEnie and checked out the TurboST and CodeHead topics for grins. I learned a few things I was not aware of, and apparently darekm@microsoft.UUCP (Darek MIHOCKA) is not either, for he writes:

| One of my main objections, which I think is important, is that there
| are a growing number of machines (especially in Germany) that are
| incompatible with Turbo ST. The TT. Overscan. Autoswitch Overscan.
| Large screen monitors. 68020 and 68030 accelerators. All of these
| enhancements will crash your ST or TT if you use Turbo ST.

The latest version of TurboSt is 1.84 and it now supports accelerators.

| Considering that Softrek (and other software developers
| such as the Codeheads) have told the ST community to not expect any
| new software from them, I find it difficult to understand how you could
| recommend their product.

Wayne Buckholdt (who *is* SofTrek) is acquiring a TT and hi-res multisync monitor to support these new systems.

CodeHead just announced HotWire 3.0, a major upgrade, available NOW. A CodeKeys upgrade is due soon.

It was distressing to learn that CodeKeys has sold only 500 copies world-wide, with estimates of thousands of pirated copies in circulation on on pirate BBS's.

BTW, I previously said TurboST did not have a auto program version - not true! I just didn't look close enough at my distribution disk. Installed it last night and it works fine.

Message-ID: <356.27CCB45E@egsgate.fidonet.org>
Source record: 234196

I know for a fact that the TT has a graphics mode that allows it do display 256 levels of gray in the 320x480 resolution. It may be that Calamus SL uses that mode no the TT to do its 256 grayscale.

S.S.

1907. TT to get AT Emulator

Newsgroup: comp.sys.atari.st
Date: 1991-02-27 18:31:24 UTC
From: Shervin.Shahrebani.Of.250/744@p0.f744.n250.z1.fidonet.org
Message-ID: <357.27CCB462@egsgate.fidonet.org>
Source record: 234193

Atari has been working on a software version of an AT emulator for their TT computer (it should emulate VGA also). When released, it will be bundled with all TT's in the future and previous owners of TT's will get the software emulator for FREE! The emulator will considerably slow down operations because it is software and the 68030 is emulating an 80286/386 chip. Therefore, expect it to run at about the speed of a 12 Mhz AT which is pretty good.

S.S.

1908. STE

Newsgroup: comp.sys.atari.st
Date: 1991-02-27 18:37:38 UTC

Message-ID: <358.27CCB467@egsgate.fidonet.org>
Source record: 234197

No, the 520 STE is only sold in Europe and comes with 512k of meagre memory. I don't like 512k. I think that now with the amazing prices 1040STE's are going for, you should get yourself a 1040STE with 1 meg of RAM. The problems with the HD's have been corrected and any STE you buy now you should check that it has TOS 1.62 rather than the older TOS 1.6 Most STE's now will have that, but check the Desk (info) just in case. I can get a 1040STE for $500 Canadian, and maybe less if I really push! I think

you should also consider the Mega STE 1 which will come out soon. It will go for $1000 Canadian. The 2/4 meg version with a 50 Mb hard disk is available now, but you are better off getting the 1 meg version with the optional hard disk. That way you can get yourself a cheaper hard disk later on.

1910. ICD AdSpeed

Newsgroup: comp.sys.atari.st
Date: 1991-02-27 19:32:11 UTC
From: bj@europa.inmos.co.uk
Message-ID: <14527@ganymede.inmos.co.uk>
Source record: 234003

Does anyone know if ICD have a E-mail address? A friend of mine has an AdSpeed board that behaves strangely -- it would be nice if we could avoid a transatlantic phone call...

The problem is that the board runs OK in 8MHz mode, but as soon as we switch it to 16MHz (using the software supplied), it instantly switches back to 8MHz! This is according to the speed display on the menu bar, at least -- and the machine doesn't run any faster :-(.

Anyone had a similar problem?

Thanks in advance,

In article <62988@bbn.BBN.COM> aking@bbn.com (Allen King) writes:
> What current MAC hardware has 256K ROMS?

Everything since the SE has 256K or larger roms. However, what is in those roms varies between computers. Both the SE and MacII(original) have 256K roms but the MacII roms have color quickdraw, nubus and lots of other stuff.
Its the same between the 1040STe and MegaSTe (assuming the MegaSTe has 256k roms like the 1040STe). They may have the same rom size space but the MegaSTe has extra code for the enhanced desktop and other hardware support.

> Which does the Mac IIfx have?

I believe all Macs introduced since the MacIIci have 512K (which includes the fx) roms.

> What kind of software breaks now without 256K ROMS?

Nothing really. I mean if it requires color, it won't work, but the old 128K Mac Plus roms are sort of the minimum compatability that most every program adheres to.

> What do people guess about the future?

I doubt that Dave Small will try to get the MacII roms running since it would take LOTS of time (he only has one life :-) , the roms are very hard to get (you basically need to buy a dead MacII) , and it would probably
cost a fortune which Atari users wouldn't pay since a real MacII wouldn't be that far away. 128K Mac Plus roms will probably be as far as it goes.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have an Atari 1040st with a problem....

It seems that the damn thing wont boot ANYTHING from the floppy drive. The drive checks out fine (tried it on another machine), the controller chip is fine (replaced it). I just checked the power supply to see if THAT was the culprit, nope. Checked the power line into the drive just in case, hmmmmm I got 13 volts going to the drive instead of 12......I wonder....The drive is a Chinon model F-354 EAT (that's DSDD to the rest of us).

ROM chips (TOS 1.0) are fine. Boots off a hard drive just dandy.

If I try to boot from a floppy I get a low res screen, and then I open drive A and get 0 bytes in 0 sectors EVERY TIME!!! I get this even if there IS stuff on the disk. Autoboot disks, nope. Non-GEM disks, nope. If I do a show info...lock up.

HELP ME PLEASE.......I want my baby back

There is a public domain PCB routing program available for the IBM
and the Mac. I know that the original C source code is also available and
may facilitate portability over to the Atari ST or Sun. If you have the Mac
option for the ST, then it should be a snap.

The program can be found for the Mac on the anonymous FTP archives
at sumex-aim.stanford.edu it is listed under /info-mac/app/pcb-cad.hqx and
is encoded in Stuffit Binhex format (Mac compression schemes). It was
origanlly written by someone at Microsoft for the IBM (and unfortunately
is as tough to use as the IBM for a mac man).

If you cannot do anonymous ftp, I can send you this program. It
comes with small instructions and modified (for macintosh) source code in
three segments (router, display, and printer). It can output in various
scales to a number of mac output devices.

Hope that helps some....

>Kitchener-Waterloo Eight Sixteen Thirty-two Atari User Group

Dani, the Windsor show is a two day show, on the weekend of May 4 and 5.
Contact Pattie Rayl (of Atari Interface magazine) for more information
regarding booths, location etc. The booths are very reasonably prices
(much cheaper than most shows) and as you can guess, Branch Always will
be represented there by at least 3 people (including myself) for the
world premier of Quick ST 3.0. If Canada Customs lets me in the country. <grin>

For people that need to fly out, they have a 40% off special with
Northwest Airlines through Detroit, although I found that flying to
Toronto and then driving to Windsor is much cheaper, which is what I'll
be doing. I knew there was a good reason for having a weak Canadian dollar!

You should call Pattie at 313-973-8825 during reasonable hours.

1915. Re: ST Roms

Newsgroup: comp.sys.atari.st
Date: 1991-02-27 23:43:25 UTC
From: vsnyder@jato.jpl.nasa.gov
Message-ID: <1991Feb27.234325.3936@jato.jpl.nasa.gov>
Source record: 234208
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have been poking around in the ROM with a disassembler, and have noticed some things that lots of other folks have probably also noticed. But attention could only improve them.

1. It's obvious that part of it was written in C and part in assembler. The parts that were written in C would be greatly improved simply by compiling them with a compiler having a decent optimizer. I don't know what quality optimizers are in existing ST compilers. But MetaWare has High C and Professional Pascal on 680x0 platforms -- it shouldn't be too great a trick to transport them to the ST. Probably the only way this will happen, though, is if Atari approaches MetaWare (408/429-META). The things one finds especially unpleasant about the present rom code are the complete lack of global common sub-expression elimination, especially array element references, and other just plain silly things that are almost completely local, such as "LINK 0" instructions.

2. The parts that were written in assembler would also benefit from being assembled with a better assembler. For example, the AssemPro assembler can be told to put references into PC relative addressing mode. There're lots of places where instructions have 32 bit addresses, but PC relative would work equally well.

3. Some of the stuff in assembler would benefit from simple things that a human must nonetheless do: all I/O addresses above $ffff8000 can be absolute short, because the hardware sign extends, that is, $ffff8800 can be coded $8800. Lots of little subprograms start "MOVE SR,-(SP)" and end "MOVE (SP)+,SR; RTS". They could instead end "RTE" or "RTR". There are a few places where one finds "MOVE.W #0,-(SP); MOVE.W #$xxx,-(SP)". These could be replaced by "MOVE.L #$xxx0000,-(SP)".

4. This isn't on precisely the same subject, but it wouldn't hurt to vector more of the intra-BIOS and intra-XBIOS calls. For example, I'd like to hook to a task scheduler at the point where FLOPRD goes into it's wait loop (What good is a DMA if the first thing you do after starting it is ask "hey, are you done? hey, are you done? hey, are you done? hey, are you done? hey, are you done? hey, are you done? hey, are you done? ... up to $60000 times)? If the intra-BIOS calls and GEMDOS-BIOS calls were vectored, one could replace FLOPRD, and not need to replace RWABS as well. Also, patches would be easier, when the inevitable bugs are found.

Is it reasonable at least to hope that the next ROM will be compiled with better tools, even if none of the expensive human-engineering intensive things are done?

I tried to use pin 2 of the monitor port on an old (rev B) 520 ST, which comes from pin 10 of the RF modulator, to control Overscan. It appears not to work. Is pin 2 not composite sync on old ST's with RF Modulators? Or is the signal computed in the Overscan document, by the two diodes and the transistor, not composite sync? It seems that the spare NAND in U14 could be used in place of the two diodes and the transistor (also need to use one of the spare invertors in U35). Anybody tried this? Also, there's ALMOST enough hardware to control overscan with GPO. Has anybody tried this?

1919. David Small versus Atari

Newsgroup: comp.sys.atari.st
Date: 1991-02-28 04:31:40 UTC
From: scoile@gmuvax2.gmu.edu
Message-ID: <3658@gmuvax2.gmu.edu>
Source record: 234207

Seeing how MORONICALLY Atari management is handling itself, a friend and I got to discussing alternate possibilities to Atari. I, for one, and a die-hard Atari fan. I think there has always been great potential with Atari, and when it first came out, the ST was a realization of some of that potential. Now, however, I think Atari is being led in completely the wrong direction. I still respect the Atari name, but I do NOT like much of what is behind it.

Where does the TRUE spirit of Atari lay now? David Small. David Small has done more for the ST than Atari itself has, and I think most people are more than willing to admit that Dave is a great, when it comes to the Atari. What would *I* like to see happen? I would LOVE for Gadgets to take over Atari (get rid of the Tramiels -- BLECH!!). Of course, there is NO WAY that is going to happen. So what if Dave decides to market an ST compatible? Perhaps in the fashion he's done with Spectre -- a clone that is more compatible than the original!! He's already done the 68030 board. All he has to do is but it in a box, add his own OS (HyperWeb still in the works Dave???), and BANG! A Small computer wipes out a "big" company like Atari! It'd be great!

And just think of the marketing ideas: "Get BIG power...with a Small computer." "It may be Small, but there's a lot inside!" What a trip!

Dave!! Listen up! You've GOT a market all to yourself here! I want to stay with the spirit of Atari (Commodore? BLECH! NEVER! PC-clone? Naww..to standard. Mac-why, when I could have an Atari/Small which can all that and more?). Whaddaya say people? Would Dave have a market? *I'd* buy a Small over a comarable Atari any day!

Here is a very simple circut that will light a LED whenever you push the
fire button. You could also use it for any other movement (joystick).

You can use any NPN transistor (like a 2N2222) you have although you may
have to change the resistor values slightly. R1 is optional....it works
fine with or without it. I didn't calculate or measure ANY values. It just
worked.

Hi Kevin,
If it is available there in the UK, there is a program written
by Iliad called "Circuit Maker 2.0". It might just be the program you are
looking for. Bye.....

Not having used PC Ditto (software) for a long time, I realized I need to do a few things on the PC. The problem is I'm having trouble installing it on my hard drive. I currently have 3 partitions (C,D, and E). On bootup, PC Ditto realizes all of these to be partition 0. Trying to get a directory on C or D results in a divide error. It doesn't recognize drive E (the infamous Abort, Retry, Failure prompt).
I have the ICD Host Adapter connected to a 20Meg drive. Also, the version is 2.0 (I seem to recall the latest version is 3.0 before Avant Garde went out of business.)

Steven

1924. 1.44mb drives

[i've posted this for james]

A few months ago, someone posted a do-it-yourself hardware mod to enable the St to use 1.44 meg drives. Could the author kindly repost this or anybody else with the knowledge please make it known ?
(Im aware that pre made kits exists to do this already but Id prefer to do it myself)

1926. Re: QL Emulator on ST

Newsgroup: comp.sys.atari.st
Date: 1991-02-28 11:07:58 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <1991Feb28.110758.27511@mathrt0.math.chalmers.se>
Source record: 234220

There is indeed a (software only) QL-emulator for the ST, but only I and a few of my friends have known about it until now (I wrote it).

The emulator consists of a small (about 4k I think) .prg file, which loads two files and patches them in ram. The files needed are straight memory dumps of the QL-rom and the Trumpcard rom.

The Trumpcard disk interface code is used because I haven't yet had the time to write my own disk directory device driver. I'm not sure I'll ever do it.

The emulator probably only works with the Swedish MGB rom now, but I will adapt it to JM shortly. I'm also trying to make it run on the Minerva roms.
Those are the only roms I have access to.

The roms are of course copyrighted, so I don't think I could distribute them, but if you have a QL with Trumpcard you need only dump them to disk and transfer them to an ST disk.

I believe you have to send in a rom dump when you order the hardware based emulators, but the Amiga QL emulator consists of a patched rom so perhaps it is legal. Has anyone talked to Amstrad (the company that bought Sinclair)?

Some info about the emulator:

The QL-screen is emulated in monochrome by a multitasking job.

It reads and writes QL-disks, but no error checking is done on writes.

Format does not work yet.

Serial comm, MIDI etc are NOT implemented yet.

Turbo, Desktop Publisher, The Editor, PSION Xchange and most other applications work just fine.

Some games, for example Scrabble, are ok, but many are not.

The speed with screen emulator at priority 32 is about the same as my QL with CST-ram.

I have decided to put the current version of the program in the public domain, but I don't think it's good enough to be posted to .binaries yet.
You could consider it a beta-release.

I won't have the time to transfer the program onto this UNIX system for a few weeks, but if you are interested, please mail me.
Questions and suggestions are welcome.

>
>ciao,
>
>Chris

A few days ago I got my copy of TurboST from a distributor here in
the UK...and I am amazed. They are up to version 1.84, if those of
you that have it didn't know...and it can make a drastic improvement
to the working environment of the ST.

I've got 4megs, and like Chris, I doubt that size of memory will effect
the running speed much, if at all...but the improvement over no TST
is stunning, especially for file opens and closes, and other simple
things like that.

I think the main improvement in this version is that it has been split
into a mono or colour or both program, which you install according
to your system. I've only got the SM124 so I can't say on speed
increases for the other options.

Running on NeoDesk 3.01 it dramatically improves the speed....

Highly reccomended...

Scott

1928. NeoDesk 3.01 question/bug?

Newsgroup: comp.sys.atari.st
Date: 1991-02-28 11:35:55 UTC
From: SAMcinty@exua.exeter.ac.uk
Message-ID: <1184@exua.exeter.ac.uk>
Source record: 234153

I recently received NeoDesk 3.01 for my STE and have noticed an odd behaviour, I don't know if this is planned, I can't find any explanations in the docs....any help appreciated:

NeoDesk in A: and some other disk in B:, if I play around with something in B:, then quit to the desktop, and close all the windows for B: then eject the disk and put in another one, then double click on B:, it seems to read from the disk (light goes on) but displays the OLD B:'s directory, or sometimes it just shows up a bunch of files with garbage characters for filenames.

Anyone have any idea why this happens? I can correct it by typing escape once I have the B: root window open, then it behaves as normal...

Running on a 4meg 520ste, if that matters.

1930. Request to ALL users of the TOS 1.6+ cookie jar

Newsgroup: comp.sys.atari.st
Date: 1991-02-28 11:37:29 UTC
From: avgroeni@cs.ruu.nl
Message-ID: <1991Feb28.113729.15166@cs.ruu.nl>
Source record: 234219

(to be skipped by more-than-average-programmers)

THE COOKIE JAR

The cookie jar is a kind of environment that has been implemented in TOS starting at 1.6. It contains pairs of longwords, one of which is the cookie identifier (to be read out in decimal ASCII), the other any kind of data related to the identifier.
IT'S A MISUNDERSTANDING people with low TOSes should not be interested in the jar. It's in fact very easy to install a cookie jar in old TOSes. If desired, I could write (and post) a short
auto folder executable that installs a cookie jar, and remains active till the next COLD boot (installing the system cookies at every warm boot).

And now for something completely different:

I REQUEST ANYBODY WHO HAS EVER DEFINED ONE or MORE COOKIES TO SEND THEM TO ME,

for at least I think there's great need of some document containing the definition of as much
cookies as possible. This would very much increase the use of the cookie jar. Please send short
messages containing simple, clear and understandable information about your cookies. When I think
I've collected enough, I will post the first version of my cookie definition list.
I'll also add (after a scientific examination) a chapter on cookie psychology (in which I'm also VERY interested)

Interesting idea. I like it. Hit two markets with one computer (ST, Mac).
Get all the nice goodies that should have benn there in the first place.
Put in a nice box WITH a HD (not the gross looking TT/STe style case either).
Something plain and simple. Who knows, maybe Small might be NeXT too.

First off, you might want to get version 3.0, which is the latest version (actually, it might be 3.01, but that is trival). Second, what brand of Hard disk are you using, and more importantly, are you using the ICD drivers, or a differnt brand (like Atari's drivers). If you are using ICD, then what is the version of that?

I have had trouble installing the DOS to autoboot off the hard disk with ICD software V. 4.1.2 (I think), but never had problems with the partition directories.

1935. Somewhat broken ST and JRI SIMM board for sale

Newsgroup: comp.sys.atari.st
Date: 1991-02-28 16:18:52 UTC
From: yegerleh@vivaldi.ecn.purdue.edu
Message-ID: <1991Feb28.161852.20181@noose.ecn.purdue.edu>
Source record: 234223

Dear Netters,

I have an old Atari 520ST (TOS 1.0, RF Modulator) with mouse,
a SS drive, power supply etc., NO Monitor, with a JRI
SIMM board installed (with 1 Meg installed) for sale. The problem is,
it's broken: when no disk drives are attached, it boots up just
fine, but displays no disk icons, of course. If either
a hard drive and/or a floppy is plugged in, the screen goes blank
at rebooting, as it is supposed to, but then stays blank
forever.

Caveat: I took it to a service place, where they tried swapping
out one of the suspicious custom Atari chips, and that didn't
fix it. So it looks to me like a broken trace or solder point somewhere,
but that's just a guess.

The JRI SIMM board has always worked fine.
I had it installed by Berkeley Microsystems.
Unfortunately I do not have the JRI installation
instructions anymore, but I do have the original disk that came
with it.

I'll start the bidding at $150, but feel free to make an offer!

Jim

1936. Re: CX80 Trak-Ball conversion

Newsgroup: comp.sys.atari.st
Date: 1991-02-28 16:19:02 UTC
From: al885@CWNS9.INS.CWRU.EDU
Message-ID: <9102281619.AA14289@george>
Source record: 234231

I took another look inside of the trakball and as far as making the right button of the tball work as the right button of the mouse is not as easy as the 2600 model. I didn't bother attempting it. However, there is a much easier and better way to get two button control.

Go to Radio Shack and buy their mini normally open momentary button switch. It's fairly small and can fit in the deep well underneath the regular buttons. Mount it on the top of the base, not the cover. Put it on the slanty part of the case. This way you can use your left hand to control the buttons and you right to move the trackball (unless you are left handed, then you just put the button on the right side of the trackball). Then again, get fancy and put one on both sides.....

Use your index finger for the button you just put in (right mouse) and your thumb for the triangular one (left mouse) already built into the track-ball.

here is a bad diagram of what I mean:

```
--------
mount '
here ' big triangular
' button
' here
'
|
|
```

BTW, remember that you have to get a brand new cable to use the right mouse button. (see instructions)

I think every SCSI-Drive has a built-in controller, so you don't need a
controller card. My drive works fine without such a thing. You only need
a SCSI-Adaptor.

Can you tell me, what a PSU is?

Don't know about MAGIC, but FLY_EX is a .PRG by Meinolf Schneider that seems
to do nothing when you start it (great for other people's AUTO folder).
After a few minutes, though, a fly starts flying over the screen, perhaps even
lands on the desktop and eats a pixel. Without docs you can only watch it
helplessly, but....

there is a possibility to kill this fly. (try the right mouse button)

Though this program is not that useful, it's lot of fun to hunt the fly,
because the damn beast reacts on mouse moves and gets more and more nervous.

>
> Donald

The chips for the upgrade aren't that expensive to buy for the
ST you need 14 of them I believe and they run you from 2.00-4.00 bucks
each...Also you had better check what type of board you got...ther are
3 different kinds for the 520...
1) you can only piggyback the chips on top of each other
this one requires alot of work..and a steady hand

2) the holes are pre drilled into the board and yuo have to
use a deslodering Iron then stick the chips in and solder them
back in (this is what I have)

3)the 1040/520 board that all you do is plug in the chips and
solder in the resistors

I personally am geting mine upgrade to a meg for $100.00
including parts and labor since it takes a lot of work to solder the chips
in and when I figured it out it was only 45 dollars in labor
which wasnt bad
hope this helps out a little bit

> neato stuff too.

I hope I didn't say that! The correct way of doing this is to use the "limit" program -- say, type "limit -M 1000K stterm" to run stterm with only 1 megabyte of memory. Or, if you want to limit all of your programs to running in 1 Mb, you could just start gem up at the beginning with that limit, i.e. start gem with "limit -M 1000K gem" instead of just "gem".

>If I do a show info...lock up.

I get this kind of behavior if I try to boot a floppy when the hard disk is
turned off. Have you tried disconnecting the hard drive and booting from
floppy, or powering up the drive and pressing the key sequence to initiate a
floppy boot (CTRL-SHIFT-ALT on Supras)?

1944. TOS version 1.6 question

Newsgroup: comp.sys.atari.st
Date: 1991-02-28 20:03:38 UTC
From: jharres@sleepy.bmd.trw.com
Message-ID: <1230.27ccffaa@sleepy.bmd.trw.com>
Source record: 234237

I recently purchased an STE which has TOS v1.6 in it. I under stand there is a problem in using a hard drive with this version. What are its symptoms? I believe I read that version 1.62 was to fix this problem. If so how does Atari handle the fix? Is it a warranty item, requiring me to take the box to the dealer for shipment to Atari? Or what?

Jim Harres jharres@doc.bmd.trw.com

Source record: 234235

From article <5440158@hplsla.HP.COM>, by andyc@hplsla.HP.COM (Andy Cassino):
>
> Just last night (Feb25) I was on GEnie and checked out the TurboST and
> CodeHead topics for grins. I learned a few things I was not aware of,
> and apparently darekm@microsoft.UUCP (Darek MIHOCKA) is not either, for
> he writes:

Darek Mihocka is not the best source of information about SoftTrek or
Turbo ST. This is not the first time he has been mistaken about
the features or compatibility of Turbo ST. I don't believe he does
so purposely but his hype does get a bit thick at times.

I recommend that anyone who is looking for a software accelerator
obtain the latest version of the demos for the various software
accelerators and and run controlled benchmarks on their own
applications. Benchmarks obtained from a dedicated benchmarking
program - particularly one written by one of the companies who's
product is being compared - may have little relation to your real
world results.

I found that all of my applications were faster with Turbo ST by a
much wider margin than the benchmarks might lead you to expect. This
was something like Turbo ST 1.8 vs. Quick ST 2.0. Don't take my word
for it, I'm a long time Turbo ST beta tester and no less biased than
Derek, try it for yourself. Find out for sure which one is better for
you, not for some benchmark.

> monitor to support these new systems.

It may be that Wayne meant not to expect any _new_ software, as
opposed to updates to old software. Considering that the TT is
supposed to be ST compatible I wouldn't call a program tweeked to
run on it "new software".

>of the Apple development team (I am not kidding), and added support for
>NuBUS protocol and other things.

The digitized pictures are ONLY in the 256K ROMS of the Mac SE, because
those ROMS are basically just the 128K code with bug fixes, plus code to
handle the ADB peripheral interface. LOTS of extra room, folks.
On the other hand, the 256K ROMS of the original MacII (and IIx, IIcx) are
crammed full. Color Quickdraw plus all the other color extensions, plus
the Sound Manager, plus the Script Manager, plus Nubus support. It all
adds up, you know. Don't ask me about the 512K ROMS, 'cause I don't know.

>
> Thanks in advance,
> Kenneth Love

If you have PageStream, you can import WWST and other formats into a
PageStream document and output PostScript to disk, then transfer the .PS file
on disk or via modem. Beware -- PostScript files produced by PageStream are
very large. They include a one-line statement specifically positioning each
character in the file. I find that a newsletter that produces a 50K file
in PageStream will blow out to 600-700K PostScript. And if you include
graphics, it will be much bigger.

>... So what if Dave decides to market an ST compatible?...
>... Whaddaya say people? Would Dave have a market?

My main gripes about Atari are that promised products/upgrades don't show up until they're nearly obsolete, there are artificial limitations in the systems (e.g. the MMU craps on you if you try to go over 4MB, even if you're willing to put in your own addressing H/W), and some perfectly good standards are ignored, apparently just to lock you in to Atari stuff (e.g. ACSI vs SCSI). If Dave Small were to produce a system that didn't have artificial limitations, that went more with standards (including especially graphics S/W standards, such as their sorry state is now), and produced products in a timely way (as he has in the past), I'd probably be interested. Right now, the NeXT looks somewhat attractive to me, because I can get one for ~$3100. But Jobs has gone off in his usual orthogonal-to-the-rest-of-the-world direction (NeXT Step and Display PostScript?).

>help.let me know your feelings

Sir,

Please, please please please PLEASE occasionally hit the shift key,
and maybe a couple of spaces after periods when you type. Also, if you are
going to put out a newsletter, take two minutes to run DOS2UNIX on it so
it will come out single spaced on the screen. I commend you for producing
such a work, but it would be ruined if it is painful to read. Also, there
is a great command in Unix called "look" which allows you to check your
spelling "on the fly" (by also using <ctrl>-z job control). If you are
unsure of how to do this, please feel free to send me email.

Please do not misinterpret this post. I am not trying to be sarcastic.
I am trying to give the "positive comments" you requested above. See ya.

1955. What the ST should be

Newsgroup: comp.sys.atari.st
Date: 1991-03-01 03:37:26 UTC
From: kurto@cc.usu.edu
Message-ID: <1991Feb28.213727.46962@cc.usu.edu>
Source record: 234114

Okay, it's been a while since anyone has posted their wants as to
what they think that the Atari ST should be, so I'll post what
I think they should be! ;-) (I'll try and make this as
realistic as possible.)

1. It should contain a 16 MHz 68010 (at the least) so that virtual memory
can be implemented. This would also require a MMU that generates
interrupts when the CPU makes accesses to memory that isn't there,
this also might cause some problems with DMA handling. Since this
would also require a hard drive then there could be some interference.
Anybody have any thoughts on this?

2. It should contain software drivers to emulate (and a socket for)
a 68881/68882. This would allow compiler writers and assembly
programmers to create one set of code for floating-point mathematics
which would take advantage of a coprocessor if it exists. And if it
doesn't then the software drivers would take care of it.

3. As for memory it wouldn't need a lot, but at least 2 Megs would be
good. By implementing virtual memory there would be little need
for any more (unless you need REAL speed.)

4. Since it is having virtual memory (assuming that DMA wouldn't
be a problem) then there would be the requirement of a hard drive,
at least 30 megabytes, having it internal would be good too.

5. As an operating system perhaps a combination of TOS 1.4 and MiNT
would be ideal. Any part of TOS that isn't implemented in MiNT should
be added onto MiNT (or the other way around, whichever you prefer.) and
then stuck into ROM. Also the standard C libraries should be ROMed so
that when you start multitasking each program won't require it's own copies.
I guess this means kicking them up to 256K.

6. To enhance networking an Ethernet interface would have to be
added, along with TCP/IP drivers. Also some sort of network file system
should be tacked on with this.

7. For video output I would personally prefer something along the lines
of 64 colors with a resolution of 1024x768 (at least). This could
be made upgradeable to 256 colors/grays at 1256x1024, or whatever people
are calling standard these days. This would allow for the addition
of windowing systems (like X, and MGR, or whatever).

If you leave out items 6 & 7 then it shouldn't cost much more than
$3000. I also think that there should be some kind of mini developers
kit made available that contains a bunch of tools and some documentaion
on the system. If someone was to rewrite the assembler from

the Sozobon C package so that it was more user friendly then just bundling
Sozobon with a set of books describing the operating system, then
it would be enough.

Anyway that's what I think should be done as a low {middle} end ST.
Maybe I'm nuts but that's what I think. If anyone has anything to say
let me here it.

```

In this list, games have been rated on a scale of 1 to 10, 10 being the best and 1 being the worst. For each game, the total number of votes, the average rating, and the vote distribution are shown. New games are indicated by a "*" before their entry. If a "(C)" appears after the title it means that the game is a CD-ROM or disc system title. If a "(J)" appears after the title it means that the game is currently only available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the percentage of votes for each ranking. The following character codes can appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes
"1" 10-19% of the votes "5" 50-59% of the votes "9" 90-99% of the votes
"2" 20-29% of the votes "6" 60-69% of the votes "*" 100% of the votes

Please consult the article entitled "ABOUT THE VIDEO GAME RATINGS REPORT" in the newsgroup rec.games.video for more details, including information on how to vote.

Questions, comments, problems, and errors should be directed to the list maintainer at either of the below addresses:

Does anyone have "The Run" demo. It's supposed to be incredible.
If you do could you upload it to atari.archive. I (and many other
people as well) would really appreciate it.
Jeff
thompson@cis.ohio-state.edu
Too bad the TT is so damn expensive.
3 grand without a monitor is a bit much.

1958. LDW Power upgrades?

Newsgroup: comp.sys.atari.st
Date: 1991-03-01 04:36:13 UTC
From: kllove@uokmax.ecn.uoknor.edu
Message-ID: <1991Mar1.043613.389@uokmax.ecn.uoknor.edu>
Source record: 234248

Okay, first off, I see that LDW has now released version 2.0. Does anybody know LDW's upgrade policy? I guess I should send in my registration card sometime in the next few days and maybe they'll notify me?

In case your wondering, the macro features have been upgraded to include stuff like if-then, for-next, etc. I think the speed has also been improved a little. Oh yeah, you are supposed to be able to do a LOT more types of graphs. I only saw it for a few minutes but some (all?) of its new features were included in the on-line help (Is this a new feature too? I never use the help on v1.1, but that doesn't mean it isn't there.).

Hope this gets a response,
Kenneth Love

>the files?

Nope ... they ran just fine when I downloaded them ... however, it seems
as though they were arc'ed or zoo'ed, not lharc'ed. I don't remember which
archiver it was.

according to Atari, ALL STe units in stock have TOS 1.62 which does
correct this problem. This problem existed on the early batches of the
STe. It has been fixed since.

If by some chance yo have one of the affected units, Atari will
replace it.

The hard drive problem, which has been fixed for about six months,
was NOT related to TOS, but a hardware error. I have TOS 1.6 in my
STe with a hard drive (old ICD host) and it works fine.

Very close. To be more specific exactly the same besides just 8Bit
Data~ and 20Bit AdressBus.

> Should be possible, but probably is difficult. Most programs on the QL are picky
> about their screen resolution :-(

Has been done. For ST with extentional hardware (for displaying 512x256).
For Amiga without any hardware but less kompatibility.

> Should be nice, though -- a QL has a better OS (IMHO) than TOS.

Depending on how you define 'better OS'. Mutitasking and windows are
nice; but passing parameters trough register? Opening windows without
saving background? No proper device handling?

Nevertheless it was some sort of genius to program a nice multitaksing
os with some sort of window handling plus a really super basic inter-
preter into just 48 kB.

From: csuac@warwick.ac.uk
Message-ID: <*V?&*=+@warwick.ac.uk>
Source record: 234170

To anyone with a Deskjet printer

I own a 1 meg St system and am looking to buy a respectable printer. The deskjet seems to be the best bet but I am concerned as to the availability of printer drivers for this machine. I will be using packages such as Calamus, 1st Word+, Degas, Deluxe Paint. Do you know if HP Deskjet drivers exist for these packages and do you have any information on a plug in Epson card for the deskjet that makes it Epson LQ compatible.
One other thing. I have only read a review on the new Deskjet 500. Do you know what the difference is between this model and the two before it, the original deskjet and the deskjet+. There seems to be an alarming price difference and I am worried there will be an alarming performance difference as well.

Would appreciate any help you can give.

|> them....
|>

I took a 1040STf (revision c, with ram UNDER the power supply) and upgraded
it from 1024K to 2.5M in about 4hours for about $80. I used two 1M SIMMs,
1 resistor and a bunch of short pieces of wire. You can go from 512 to
1024 by just dropping in 16 more of the dram chips you already have, but
2.5M is much nicer. Should I post a pin mapping (SIMM to motherboard)?

Memorably,
Bill Magro

The sun's GUI suntools (now called sunview) was a specified standard GUI.
The atari's OpenLook is based on sunview. In fact, OpenLook (what i am running
right now on this SPARCstation) has a nearly identical programming interface
to Sunview's. You could say that open look is sunview with an X-window's
protocol...

Graphically,
Bill Magro

> gulam.g file (so it gets executed when you enter Gulam). You could put
> 25LINE.PRG in your ".logout" (I cannot remember what it is called for Gulam,

They are also known as HI50 and HI25. I'm including them here since
they're so tiny. uudecode and unarc to extract. They only work for
TOS and TTP programs in monochrome mode (but, IMHO worth their bits in
gold when using programs that recognise the extra screen resolution...).

table
!"#$%&'()*+,-./0123456789:;<=>?
@ABCDEFGHIJKLMNOPQRSTUVWXYZ[\]^_

[Inline uuencoded payload not displayed: hi_prgs.arc]

PS: Regarding the original question. I think gulam either has HI50
built into it or supports the use of HI50 using an environment variable.
Try either::

set nrows 50
-or-
set nrows 50
hi50

to invoke 50 line mode under gulam. (Sorry I don't remember which,
but I rarely use gulam...) Use whichever works with 25 substituted for
50 to reverse the process. Again, this only works on a monochrome
screen (although the lines per screen gets real(!) impressive when
using hi50 on a moniterm monitor... :^)

Note that the use of HI50/HI25 does not require gulam. You can run
HI50 on any system using a mono monitor, from the desktop or any cli
(command line interface) program and, even though it won't effect the
desktop, it will expand the number of lines per screen (and shrink the
characters) for all TOS or TTP programs run after that until you run
HI25 to reverse the process.

1976. Using Minix filesystems in MiNT!

Newsgroup: comp.sys.atari.st
Date: 1991-03-01 13:06:11 UTC
From: david@doe.utoronto.ca
Message-ID: <1991Mar1.130611.1777@doe.utoronto.ca>
Source record: 234198

Guess what? The Minix ST demo disk just announced by Andy Tannenbaum in this newsgroup sports a _working_ mkfs. I have made my D partition into a Minix partition. Even though I don't have Minix, I can use MiNT 1.7 (the mintm.prg version), which supports Minix, and I have a partition which can use filenames like y.tab.c or hack.tar.Z!!

WARNINGS:

1) KNOW what you're doing. I disconnected my main HD and tried it out on my old Megafile 30. Even then, I ended up having to reformat the whole thing (including the C partition) the first time around. Try using the command on a floppy first.

2) Read all of the cautions in the MiNT distribution on using Minix file systems.

Happy hunting!

1977. tri-sync monitors

Newsgroup: comp.sys.atari.st
Date: 1991-03-01 13:09:05 UTC
From: wmagro@roma.uiuc.edu
Message-ID: <1991Mar1.130905.27855@ux1.cso.uiuc.edu>
Source record: 234165

A lot of companies have come out with monitors called 'tri-sync.' I believe these are like multisync monitors, but are cheaper, because they can sync only to vga, ega, and cga modes. My question is: are the atari color modes (scan rate) the same as ega or cga? Or is it possible for the atari to sync externally off one of these monitors?

Waveringly,

Bill Magro

1978. TeX on the ST (How ??)

Newsgroup: comp.sys.atari.st
Date: 1991-03-01 14:01:18 UTC
From: oddjob@oz.plymouth.edu
Message-ID: <1991Mar1.140118.25399@oz.plymouth.edu>
Source record: 234173

I'm interested in using TeX/LaTeX on my 1meg 1040STf.
I was just looking in /atari/tex on atari.archive.umic.edu.and there
is 10 megabytes of stuff in that directory......
Does anybody have any idea what files I would need from there to get
TeX up and running ?? I've got a list of other places for things like
style sheets but before I do that I need to get the right stuff to use
it with.

I was thinking of investigating this myself but I don't have the disk
space (floppy or harddrive) to d/l EVERYTHING there (I was going to
UNTIL I saw how much is there....)

In other words.... help.........

Andy

I don't have any firm advice except that I am a firm believer in the
"No black magic" principle. It kept my sanity when I was programming the
Amiga (spit). You hve started out on the right track.

My advice is to take the board out and stick it in your friend's machine,
ie

```
if friend's machine with your board works then
while it works and not attachments run out do
exchange one attachment from your friends machine with own attachment
try again
end while
if attachments ran out then
write (" Your having me on ")
else
write ("The last thing you exchanged is the faulty component")
endif
else
write ("something major wrong with your board")
write ("Do you still want a 1040?")
read (reply)
if reply in ['y','Y'] then
if cost second hand < cost new then
get a second hand 1040
replace your board for the one out replacement
cannibalise the rest for spares
keep old board!!
else
if cost new > prepared to pay then
try buying a new replacement board
else
buy new st
endif
if not(replacement available) then
write ("Sorry use your friends 1040") or
get board serviced professionally
endif
endif
else
choose new type of machine
endif
endif
```

hope you get it fixed,
Fraser

1981. Several Questions

Newsgroup: comp.sys.atari.st
Date: 1991-03-01 14:51:48 UTC
From: oddjob@oz.plymouth.edu
Message-ID: <1991Mar1.145148.26585@oz.plymouth.edu>
Source record: 234175

I have several wierd questions:

1. My 1040STf has a Rev. B board #C07078 -001 with the 6 ROM set (TOS 1.0)
I recently opened it up (the warranty expired years ago) and have some
questions about it :
a. What are A16 and A17 near the ROM's and CE (I think) next to U56 ?
They are each two solder bridges of some sort the the letters
256k and 1M above or below them. The 256k bridge has solder in it
completing the circuit while the 1M bridges are clear. Any ideas ?
b. What are U65 and U68 ? Do they have anything to do with U65 (which
I assume (from its shape/size) is where the blitter is supposed
to go.
c. Does anybody sell the blitter (and a socket for it) ? And what else
would I have to do to get it to work ??

2. I got PC Ditto II a long time ago (as an update to PC Ditto) and it is
cracked straight across its' width.
a. Is there any way to fix it ? I could solder it but is there a better
way ?
b. There "seems" to be an NEC V30 chip on the PC Ditto board. If I can't
fix it what do I do with it (it's socketed) ?
c. (Best question yet.:-) ..) Does anybody remember the clip you're
supposed to fit over the 68000 ? Is there any other use for it ? (I'm
dreaming of using it to simulate a MegaBus so I can get David Small
& Co.'s 68030 board instead of waiting for the TT to become obsolete
before I get it.

Please reply via E-mail if at all possible :-) . If there's enough (how
much is enough?) response I'll summarize and post :-)
Thanx :-)

That's a project for Dave! A replacement MMU! Damn! If I had the Ca$h I'd do it now: Through something like the Mosis Service till I get good silicon or maybe a Semi-custom solution through one of the major vendors.

You know, Dave could add hardware memory protection, bank switching, additional ROM space, etc, unless he feels he can use the onboard MMU of the '030. Does the TT's OS take advantage of this guy, or does the OS simply pretend its not got an MMU? I dunno.

Think about it!

1983. Multi-line bbs possible?

Newsgroup: comp.sys.atari.st
Date: 1991-03-01 15:13:25 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Mar01.151325.5556@chinet.chi.il.us>
Source record: 234182

I'm toying with the possibility of setting up a product support bbs (no, the product isn't out yet). Being an eternal optimist (I still use Atari stuff, don't I?), I'm curious about how I'd go to multiple lines if that was necessary. It seems like a question that might be asked fairly often. So given ST rather than Mega E or TT hardware, is there a good way to set up a multi-line BBS? The best IBM PC multi-lines seem to use multiple networked machines. Is a suitable networking product available in the US? Is there a good way to get multiple serial ports on an ST?
Steve saj@chinet.chi.il.us

1984. SPECTRUM 512 information

Newsgroup: comp.sys.atari.st
Date: 1991-03-01 15:21:16 UTC
From: lsmichae@immd4.informatik.uni-erlangen.de
Message-ID: <1991Mar1.152116.2195@informatik.uni-erlangen.de>
Source record: 234171

Hi netlanders,

there was some confusion about the format of a SPECTRUM 512 picture.
I've done some work and here are my results:

The description of the file format of *.SPU and *.SPC in the ST
picture formats document made by David Baggett is correct.

I have some correction for the area of validity of the colors.

In a SPECTRUM 512 picture each scan line has three color palettes,
that will make 48 colors. In the following I will number these three
palettes from 0 to 2 (first palette 0), e.g. color 45 will appear in
palette 2. All three palettes build the one *virtual* palette.
All scan lines are independent from each other.

The ST has one hardware palette of 16 colors. Let me call this the
real palette.

Get the index <cnr> of a color of the virtual palette, the valid area
will apear in the following table (left and right border are
inclusive).
left border right border
Palette 0
0<cnr<=15: cnr odd 0 10*cnr-6
cnr even 0 10*cnr-1

Palette 1
16<=cnr<=31: cnr odd 10*(cnr-16)-5 10*cnr-6
cnr even 10*(cnr-16) 10*cnr-1

Palette 2
32<=cnr<=47: cnr odd 10*(cnr-16)-6 319
cnr even 10*(cnr-16) 319

Color 0 in palette 0 has no valid area and is the border color.
SPECTRUM 512 sets the colors with number 0, 15, 16, 31, 32 and 47
to black [$000].

With the above table its not difficult to create a corresponding table
where you can get thy real palette from a x-value of a pixel.

1985. Re: SPECTRUM 512 information

Newsgroup: comp.sys.atari.st
Date: 1991-03-01 15:24:47 UTC
From: lsmichae@immd4.informatik.uni-erlangen.de
Message-ID: <1991Mar1.152447.2460@informatik.uni-erlangen.de>
Source record: 234172

Hi netlanders,

I have made some small conversion routines to a new intermediate picture
format called RGB and a routine from RGB to uncompressed SPECTRUM 512
format. The results a very nice !!!

The RGB format goes like this:

<RGB intermediate format> *.RGB (only low resolution)

1 word resolution flag (ignored)
16 word color palette (ignored)
16000 words red values of the picture (screen format)
The color index of the point gives the R-value
1 word resolution flag (ignored)
16 word color palette (ignored)
16000 words green values of the picture (screen format)
The color index of the point gives the G-value
1 word resolution flag (ignored)
16 word color palette (ignored)
16000 words blue values of the picture (screen format)
The color index of the point gives the B-value

96102 bytes

You may have noticed that each of the R-, G- and the B-planes looks like
a DEGAS *.PI1. That's right and you may set the palette to increasing
gray values to have a look at the R-plane.

Caveats:
The color palette is *always* ignored. To get the color value
from a pixel get the color indices of the correlated pixels in
the R-, G- and B-plane and build directly the RGB-value 0xrgb
(no indirection to the color palettes)!

I hope there's a discussion about this "new" picture format.

My conversion routines are
TMPTORGB, (DBW-render temp file to RGB intermediate file)
PI1TORGB, (three DEGAS files to one RGB intermediate file)
IFFTORGB, (AMIGA IFF file to RGB intermediate file)
RGBTOSPU. (RGB intermediate file to SPECTRUM uncompressed)

Some notes:
- PI1TORGB is used to concatenate digitized R-, G- and B-planes
(each plane stored as DEGAS picture).
- IFFTORGB uses the CAMG chunk and recognizes HAM and INTERLACE.

- RGBTOSPU runs up to 10 minutes, depending on the file. It
calculates a color histogram and looks for the best fit of the
maximum color in the scan line. If the virtual palette is full
all left pixels are set each to the color index of the nearest
color in the *real* palette.

Some future projects are:
GIFTORGB, (GIF file to RGB intermediate file)
SPUTOSPC, (compress SPECTRUM file)
SPCTOSPU. (uncompress SPECTRUM file)

If there's some interest in these routines I'll post them to
comp.sources.atari.st and comp.binaries.atari.st.

Lars
P.S.:
Someone out there who has a gif decoder? I have knowledge
of the LZW-compression used in gif files, but would prefer
to get sources for this to save sleep, tea and sweat ...

From: george@electro.com
Message-ID: <1991Mar1.153911.2860@electro.com>
Source record: 234179

My balloon burst when I was told this morning by
ICD technical support that they don't now , and
never will support the OMTI 3100 SCSI controller.

Why did this burst my bubble? 'Cause I finally found
a used SCSI drive that I could afford, bought the
ICD host adapter, made all the connections, and.... 8^(

The drive I have is a MicroScience HH725 (20 mb)
and I was told by ICD that I needed either a

ADAPTEC 4000 or
ADAPTEC 5500 (preferred)

Does any one out there have such a device?
Please mail me at george@electro.com
or phone 519-744-7111

> There is another version, 1.12, which supports Postscript output to disk but
> there are none after that. Usual Atari vendor support!

This is both right and wrong. Electric Distribution (or GST, or
Softline, or whatever name they're using for this purpose) have just
last month (Feb 91) issued an update. Confusingly, this is still
version 1.12, but they're officially calling it v1.h12.

There are no amazing new features. TT support is added, and allegedly
the installation procedure works better. Various unspecified bugs are
said to have been fixed. Pressing 'esc' now redraws the screen. I
haven't yet tested whether the 12pt Dutch font for the Atari laser
printer now prints questionmarks properly. Oh, and multiple copies are
supposed to print properly now.

Anyway, the upgrade is available from GST/Electric/Softline in the UK
for 8.95 pounds (or 4.95 if you're a Softline member). You need to send
in your old master disks.

First Word Plus (written by the same outfit) has also been upgraded, to
version 3.20TT, and is available at the same price. Again, it's mainly
TT compatibility and bug fixes, but you can now choose whether to have a
flashing or a steady cursor, hyphenation has been improved by the
addition of an exceptions dictionary, and scrolling speed is faster.

So then I'd say that it is really random whether the <Esc> function works
or not. Or is it defined that Fopen() clears A0? If not, the desktop cer-
tainly would crash!! (3 Bombs, I tried it by changing A0)

>1st Word+, Degas, Deluxe Paint. Do you know if HP Deskjet drivers exist for
>these packages and do you have any information on a plug in Epson card for the
>deskjet that makes it Epson LQ compatible.

I have a Deskjet 500, and printer drivers haven't been a problem for me.
The primary applications that I use with my Deskjet are Word Perfect (which
supports the Deskjet fine) and Easy Draw (which works WONDERFULLY with the
Deskjet). For Easy Draw, I ended up buying a GDOS driver directly from
Migraph. If you want to print to a Deskjet from a GDOS application, I would
recommend looking into this driver. It's fast, seems pretty robust, and the
output looks great.

As for your other applications, I can't say for sure, but I wouldn't think
it would be a problem. Calamus supports lots of high-end output devices, so
I imagine the Deskjet would be included. If there isn't one for 1st Word+,
I'm sure that you could create one pretty easily. I haven't needed a driver
for Degas yet, but if I do I plan to create one with Tom Hudson's Printer
Driver Construction Set. I can't comment on Deluxe Paint.

As you say, you can get an Epson emulation cartridge. It retails for around
$50 (I think) and lets the Deskjet respond to Epson FX commands. If you
really can't get or build a Deskjet driver for a particular application, you
could go this route.

>One other thing. I have only read a review on the new Deskjet 500. Do you know
>what the difference is between this model and the two before it, the original
>deskjet and the deskjet+. There seems to be an alarming price difference and I
>am worried there will be an alarming performance difference as well.

The Deskjet 500 is quite a bit faster than previous models, has a
newly-engineered ink (water-resistant, unlike previous inks), and has more
built-in fonts than the Deskjet and Deskjet Plus. If you want to buy a
Deskjet, I would recommend that you go with the Deskjet 500. They can be
had for $450 - $500.

If you can, connect a hard drive, WITHOUT ANY VALUABLE DATA ON IT, to
your STe for about an hour or two or more if you can, and move files
around, load files, save files, etcetera. Do a lot of file stuff.
What you'll see first is that the directory entries will be skewed
two characters (or two bytes??); this is what happened on a Megafile
I saw at a dealer. On my ICD drive, I got 'Drive *: not responding'
and some other drive-related errors, but luckily no data was lost.

You may or may not have the hard drive (DMA) bug, but there's no
other way that I know of to check it. It may take longer than a
couple of hours to check. Mine occurred, if I remember correctly,
within 4 at the most.

Moreover, from what I hear, it was only a small percentage of STes
with this problem (Atari says 10% I think). Even though the STes
were in Canada and Europe first, the problem didn't seem to crop up
until they were released in the US.

| know LDW's upgrade policy? I guess I should send in my registration card
| sometime in the next few days and maybe they'll notify me?

Nah, I've sent my registration in and upgraded once already, they apparently
don't mail out upgrade notices, or if they do, I don't get 'em!

I think I saw on GEnie that the upgrade is $49.95. I also saw some complaints
about bugs in the new graphics stuff (of the irritating type) which dampens
my enthusiasm for spending that kind of dough on an upgrade. I think I'll
wait a bit and see how things shake out.

>these printers. Basically, if the Canon has a drivers, I'll get it.

There is a product by HP that may be what you want. It's called
MacPrint and is some software and a cable to allow a Mac to talk to a
DeskJet. You won't want the cable, but the software may work. I
don't have any kind of Mac emulator so I can't verify it. It's part
number is 35177A.

Has anyone ever tried this? Someday, if I ever get a Mac emulator, I
would try this.

I know there's a GDOS driver by Miagraph(sp?) for the DJ.

>Which should I get? The Canon or the HP:

I think you should get the HP, but I'm probably biased :-).

2001. Should I try to make a 1040 a Mega 4 ???

Newsgroup: comp.sys.atari.st
Date: 1991-03-01 20:09:40 UTC
From: SYSPMZT@gecrdvm1.crd.ge.com
Message-ID: <91060.160940SYSPMZT@GECRDVM1.BITNET>
Source record: 234187

I'm a long time owner of a 1040 ST, from the early days, though suprisingly I know little about the guts/upgrades or even available software. I use the machine for MIDI sequencing, and that's about it.

After 4 years or so, my machine is getting pretty shabby, and has a nifty disk controller problem, besides being a TOS 1.1 machine with the file dialog bug and the like. I'm also severely memory constrained. I don't want to invest any money in a machine I'm convinced will roll over and expensively die one day soon.

So, I've been thinking about getting a Mega 4, but I can't really afford the full deal, even already owning a monitor (my 3rd, actually). A local music store starting selling 1040's with monitors for $599 recently, and it got me to thinking: I don't really care about the blitter chip for my application (do I?), and don't really need the new keyboard (I only press single key commands at a time), and though I'd like the detached keyboard, I can live without it.

So, finally, my questions: Can I easily upgrade the memory of a new 1040, can I do it myself (I don't solder well), or are there a number of firms/ individuals that can do this for me? If the latter is the best recommendation, any advice on who to do the upgrade? Lastly, am I missing out on anything big by not going with the Mega 4? I don't read ST magazines, and poke my head into this category infrequently, so I'm not as well-educated as I should be on the subject.

All advice very gratefully appreciated,

Phil Z.

2006. supercharger question

Newsgroup: comp.sys.atari.st
Date: 1991-03-02 01:42:57 UTC
From: depeche@cs.mcgill.ca
Message-ID: <1991Mar2.014257.7119@cs.mcgill.ca>
Source record: 234199

I just spoke to Rio computers, and the tech support guy told me that
one of my problems could be solved by changing the DMA address of
the supercharger to 6 instead of 3 (according to him it seems that
the SUPRADRIVE clock is using device number 3).

There is a utilitiy called quiet.prg which comes with the 1.4 software
upgrade. I think it does what i need it to do , but it is hardcoded
for DMA address 3. Does anyone have a modified version of quiet.prg
which works for a supercharger in device number 6?

Any help would be appreciated!!

2007. Re: PCB designers

Newsgroup: comp.sys.atari.st
Date: 1991-03-02 01:59:32 UTC
From: squishy@casbah.acns.nwu.edu
Message-ID: <1991Mar2.015932.12621@casbah.acns.nwu.edu>
Source record: 234102
Cross-posted to: comp.sys.atari.st,sci.electronics

OK, I haven't logged in for two days, and there are *MANY* requests for the PCB designer program I mentioned earlier. It is much easier for me for those interested to try anonymous ftp and obtain it from the archive I mentioned (sumex-aim). I also found some information regarding the original IBM PC version of the program. For those that wrote and mentioned (few said this) that they didn't have ftp capability, I could upload the program to the sci-electronics newsgroup, but it is a 410K uncompressed program, and would take A LOT of bandwidth (Is that OK?).

Once again, the mac version is available via anonymous FTP from the archives at sumex-aim.stanford.edu. It is listed under /info-mac/app/pcb-cad.hqx. >>>> Please try anonymous ftp FIRST <<<<

The original IBM PC version is available from the author (from the readme file) if you send a disk and Self-Address Stamped Disk Envelope Mailer. He works for Microsoft, and his address as of (1/89) is:

Randy Nevin
1731 211th PL NE
Redmond
WA 98053

Hope that helps...

|>
|> thanx
|> james

If you have info on upgrading a 520 from .5 to 2.5, then this is all you need. I had a 1040St and a pair of wire cutters, and it was a 520 in no time! *:^) From there it was a .5->2.5 project.

If the info you speak of is a .5->1M upgrade for the 520, then that is a different story. You'll need my info.

I was going to put some time into doing a nice writeup of the project and then release the document as shareware. It is so hard to hoard info though, so I may just post it here.

As the question about what program broke due to no 256K ROM-- as far as I know only those use Color Quick Draw would need 256KB and newer ROM that is in SE30, IIc* etc. (Since the Mac Color is handel by additional board hardware even with color quick draw might not necessary bring the program to work). All the nice and useful program like MPW, WP, Word ... works just fine with 128K ROM. Afterall the Plus was the popular Mac model.

saj@chinet.chi.il.us (Stephen Jacobs) writes:

- I'm toying with the possibility of setting up a product support bbs
- (no, the product isn't out yet). Being an eternal optimist (I still
- use Atari stuff, don't I?), I'm curious about how I'd go to multiple
- lines if that was necessary. It seems like a question that might be
- asked fairly often. So given ST rather than Mega E or TT hardware, is
- there a good way to set up a multi-line BBS? The best IBM PC
- multi-lines seem to use multiple networked machines. Is a suitable
- networking product available in the US? Is there a good way to get
- multiple serial ports on an ST?

Atari uses DC-Port on a Mega4 for their 5-line BBS, running Michtron BBS v3.0. DC-Port, from what I hear, plugs into the cartridge port of any ST and gives you either 2 or 4 extra serial ports. The only BBS program that I know of that supports it is Michtron BBS v3.0. Niteline BBS is supposed to be able to run multiple lines, but I don't know what hardware it uses. STalker, the fantastic terminal program, also supports DC-Port. You can have 3 STalker terminals installed, with each calling a different place using DC-Port. DC-Port is a Double Click product. Your best bet is to contact them.

Source record: 234107
Cross-posted to: comp.sys.atari.st,misc.forsale

I recently inherited an old Atari 520ST, complete with hard drive
et al, and I now find myself with more hard drives than I've got a
use for. The machine I inherited had a Quantum 80S in it, which in
one fell swoop made my existing HD (SH205 upgraded to a Tandon 755)
obsolete. Plus, I've a full-height Micropolis drive (both of these
drives are 40+ mb and autoparking) that I was intending to wire into
the SH205 before I got the speedy tiny drive.

So.... I'd like to get rid of the SH205 and/or the Micropolis.
I'm amenable to haggling, but I'd prefer to sell the puppies for:

SH205 -> $250
Micropolis -> $150
(combined) -> $375

with me paying shipping and all that. If you're keen on a hard drive
or two, lemme know either at the address here, or one of the following
addresses (internet):

orc@bach.sql.sybase.com
orc@jazz.sybase.com

(I believe I set the distribution on this article to north america -
the SH205 is wired for 120VAC/60HZ, so it probably won't work elsewhere)

March 2/91
Here are some follow up questions i had for Lee Seiler at
LEXICOR:

1). How many colors on screen and what is resolution with your
24-bit color board and Atari 1224 on an ST?

** With 2megs of RAM, 16 million, 256 on screen, 512x512
FULL SCREEN "virtual screen".. NOT overscan.

LEXICOR will be supporting 4 boards:
MATRIX
LEXICOR
ICD
ISAC

2). WIll the Gadgets SST 030 board work with LEXICOR.?

** As far as I know it does.

3). A few people from the Amiga groups figured you must be
using a "$50 monitor" on the Amiga 3000 when you made
comparisons between the TT display and the A3000 display.
What monitor did you use on the A3000?

** Nanow flexscan $1600 monitor. I have the amiga and TT
hooked up to the same monitor.
The TT display is much more dramatic and purer
than interlace on amiga... the overscan on the amiga
gives you a shredded looking edge.

4). Can you import DynaCADD drawings and render/animate them
with LEXICOR to do architectural walkthroughs?

** Of course!

5). The Amiga is a great graphics machine... particulalry when you
have vendors like NewTek putting out the Video Toaster.
Anything like that going to happen for the TT?

** There will be a direct marriage of Video Toaster with TT
put out by reputable company THIS YEAR.

Really? Some people buy the Amiga FOR the Toaster.

** Definitely! You will definitely see the Video Toaster on the
TT this year. NewTek wants the ATARI market.

6). I am still impressed with my 8mhz 1040ST upgraded to 4MB RAM.
There is some software for the ST that really makes this box
seem like a lot more machine. My guess is that the TT
must be an excellent system.

** It is wonderful!

Atari already has a strong hold in the music market.
If ATARI supports you guys in your graphics
development, I should think LEXICOR and others that follow
you will help make ATARI more competetive in the US. Is ATARI
supportive of your efforts?

** ATARI just now made the decision to get into professional
animation and DTP. People at ATARI are vey helpful, and
contrary to a lot of people's claim that they don't care,
ATARI people DO care and are trying very hard to provide great
products at affordable prices.

********** A number of other questions deleted **********

I wonder about Lexicor. When I read their ads (circa Dec. 1990) I was more then a little skeptical. This is because they had these elaborate pencil drawiings of fantasy/sci-fi mechanisms with thousands of faces, and they boasted, somthing like "would like like to animate something like this? We do it all the time!!" So I would think, "Hmmm.. if they animate this kind of stuff "all the time," why don't they show a screen shot instead of a pencil drawing?

On #3- I haven't seen a TT display, so for all I know it is superior. However, the Lexicor fellow made references to the "flicker." Apparently he is unaware that the A3000 has a built-in deinterlacer. I HAVE seen the A3000

display, and it is very good. Like I say, the TT might well be better, but this fellow from Lexicor seems to be making it sound wretched, which it is not.

On #4- I have a very hard time swallowing this one. Come on. NewTek has stated it will NOT move the Toaster over to the Mac or the PC. What makes this guy think that they would ignore these markets, which are anywhere from 10 to 30 times larger than the ST market, in favor of the ST? The Toaster uses Amiga custom display chips as part of its integral operation. This is why it is on a Amiga. Now if he is saying a 3rd party is going to bring it over, then that might be possible. It would be tough, and I don't think it will be here "within the year" (unless the party gets Commodore to sell them Amiga custom chips) but I can say no more about that topic.

Mainly, this guy, from what has been posted here and from his ads, does not seem to be the font of credibility. His attacks on the Amiga reduce it still further. Not that the Amiga is above crticism, hardly that, but what he did say is very questionable, was not technically justified, and very inflammatory. Hopefully one of the Atari mags will give a review of his stuff (did I hear STart mag mentioned) but until then I cannot take him seriously.

2022. Needing to get a colour monitor

Newsgroup: comp.sys.atari.st
Date: 1991-03-02 20:04:28 UTC
From: orc@vpnet.chi.il.us
Message-ID: <1991Mar02.200428.26323@vpnet.chi.il.us>
Source record: 234132

I recently bought a copy of SimCity for the ST (having played it into the ground on the PC, I just had to have it on a machine at home) and discovered, to my intense dismay, that it requires a colour monitor. Which, of course, I don't have. However, I do have an Amiga, and it has a colour monitor - sooo, have there been any attempts to attach an Amiga A1080 (or whatever number it is - it's the one that was inflicted on A1000 purchasers) colour monitor to a ST?

(It's moderately annoying - I've got monochrome ST monitors coming out my *ears*, but of course most of the US games, including the tiny subset that I play, can't even spell monochrome, much less use it...)

2023. Re: Should I try to make a 1040 a Mega 4 ???

Newsgroup: comp.sys.atari.st
Date: 1991-03-02 20:13:35 UTC
From: carter@cat27.cs.wisc.edu
Message-ID: <1991Mar2.201335.21549@daffy.cs.wisc.edu>
Source record: 234131

SYSPMZT@gecrdvm1.crd.ge.com writes indubitably:

I'm a long time owner of a 1040 ST, from the early days, though suprisingly
I know little about the guts/upgrades or even available software. I use
the machine for MIDI sequencing, and that's about it.

After 4 years or so, my machine is getting pretty shabby, and has a nifty
disk controller problem, besides being a TOS 1.1 machine with the file
dialog bug and the like. I'm also severely memory constrained. I don't
want to invest any money in a machine I'm convinced will roll over and
expensively die one day soon.

So, I've been thinking about getting a Mega 4, but I can't really afford
the full deal, even already owning a monitor (my 3rd, actually). A local
music store starting selling 1040's with monitors for $599 recently, and
it got me to thinking: I don't really care about the blitter chip for my
application (do I?), and don't really need the new keyboard (I only press
single key commands at a time), and though I'd like the detached keyboard,
I can live without it.

So, finally, my questions: Can I easily upgrade the memory of a new 1040,
can I do it myself (I don't solder well), or are there a number of firms/
individuals that can do this for me? If the latter is the best recommendation,
any advice on who to do the upgrade? Lastly, am I missing out on anything
big by not going with the Mega 4? I don't read ST magazines, and poke my
head into this category infrequently, so I'm not as well-educated as I should
be on the subject.

MMmmm, I think the best thing for you to do, is to save your money and buy
a MEGA 4...

Even better, if your needs aren't impendably pressing on you, get a MEGA 4
STe.

You could be missing out if you go with a 1040, it depends on your goals
and the relative kinds of work you want to do. I forked out the massive
dollars for my machine because I wanted all of the capabilities of finally
owning an Atari machine that you can upgrade without voiding your warranty.
With a VME bus, the possibilities are endless! But I also wanted a faster
machine too, since I do a lot of programming and hate to wait for anything!

I also run Mac software for a lot of things like programming, DTP, WP. and
just to be in a nice computing environment that is pleasant.

You also won't get the new TOS 2.05. Its pretty nice, and was an unexpected BONUS as I always though t the desktop SUCKED MASSIVELY, and was kinda in the ROMS because Atari was afraid using the extra space for a multitasking OS would be overkill, so they just made the desktop and "threw it in there.".

But let me get straight to the point:

1) If you buy a 1040ST, you won't be able to get the SST board that Mr. Small is making for the MEGA machines, in the same configuration that is. I do believe in the 1040ST implementation he is cutting the floating point support because of space constraints. THAT WOULD SUCK.

2) To my knowledge, Large Screen displays are only available for the MEGA. So if you want a nice large screen display in your future sometime, forget it.

3) You can internally install a hard disk in the MEGA, which EGADS, probably one of the most unexpected PLUSES you can get! IMAGINE THIS, ONE power cable for the computer and ONE for the monitor and THATS ALL. NO MORE RATS NEST! I don't even need a power strip to plug my machine in someplace as I only need a two outlet wall socket which does just fine.
(I live in a dorm, so SPACE COUNTS, SO WHAT IF I AM 24! I still act like a teenager, dam proud too!)

4) OK the last point I would like to make is THE DETACHABLE KEYBOARD. I didn't think it was such a big deal, BUT IT IS. If I couldn't lazily relax on my bed while doing cs536 asignments I would go nuts like those poor slobs down in the terminal room who have to live in the computer lab 20 hours a week! (HA HA. Poor things....SUFFER! :))

Well those are my reasons! There are more, but I don't like typing long messages...

--Gregory

2024. Re: 1.44mb drives

Newsgroup: comp.sys.atari.st
Date: 1991-03-02 20:26:02 UTC
From: hase@netmbx.UUCP
Message-ID: <2029@netmbx.UUCP>
Source record: 234128

billy@phoenix.pub.uu.oz.au (Jeff Coleman) writes:
> A few months ago, someone posted a do-it-yourself hardware mod to enable
>the St to use 1.44 meg drives. Could the author kindly repost this or
>anybody else with the knowledge please make it known ?
>(Im aware that pre made kits exists to do this already but Id prefer to do
> it myself)

It is pretty easy.

The trick is to double the clock of the WD1772 floppy controller chip to
get HD bit streams.
The regular clock is 8 MHz and 16 MHz can be get from the shifters 16
MHz output (see the Abacus Internals book for the pinouts; if the Abacus
book is the translation of the german Data Becker book, it should have
all the pinouts).
You could use a simple switch to changs the clock, but I found a
Multiplexer (1/2 74LS157) controlled by the "HD disk in drive" output of
the Teac FD 235 HF more elegant...
For the 5.25 inch Teac FD 55 GF I use a switch...

The problem ist, that the floppy controller will step twice as fast with
the doubled clock; that will be too fast for any drive mechnism.
So You'll have to set the step rate to 6 milliseconds to make the
controller step at 3 milliseconds in HD mode (6 ms in DD mode does not
hurt performance too much, so You can leave the Controller at 6 ms all
the time).
Setting the seek rate is easy: write the appropriate seek rate code (6
for 6 ms, I recall) to the seek rate system variable (is it at 0x4c0 ?
Check it...) and then jump to the "hdv_init" routine (the adress of that
routine is found in the system variables, too.) hdv_init will make new
BIOS parameter blocks for both drives with the new seek rate.
This works with any version of TOS, cause it uses documented system
variables and system calls only, but it will affect the seek rate for
both drives.

Now, all You need is a formatter program that will format 18 (or up to
20) sectors per track (or 15/16 sectors per track HD 5.25 inch).
A simple formatter using the XBIOS format routine is in the Mark
Williams C Compiler docs. I hacked it to use a track buffer twice as
large and it formatted HD disks with 18 sectors...

Thats all!

Source record: 234118

szhu@tasha.poly.edu (A1 shu bin zhu (cs)) writes:

>Is there a way to set the serial port above 19200 baud on the ST?
>The MFP chip can handle upto 56.2K baud, there must be a way.

There is no way to do it in software:

One of the timers in the MFP is used to generate the send and receive
clock for the serial interface. Using the standard clock frequency and a
pre-divider by four (this is necessary for async. operation) it can
generate clocks up to 19200 Baud.

The only way is to cut the send clock and receive clock input pins of
the MFP an feed it with a new clock (from extra hardware).
I planned to try it, but never found the time to do it...

Try it out. You can still reverse the little hack and up with nothing
more but some experience :)

I'm sorry, but you obviously either didn't use a A3000, or didn't plug the multiscan monitor into the de-interlaced output of the A3000, as opposed to the 15kHz ntsc output. The shredding you saw in overscan is a bug in the earlier display chips and was fixed in the new enhanced chip set (which by the way is in the 3000)
.

For some reason, I can't see this happening. Especially the fact that to the best of my knowledge, no Atari machine has a video slot, or any expansion slots whatsoever for that matter.

Go ahead, flame me!!!

2027. v14INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1991-03-02 22:00:17 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <963@grapevine.EBay.Sun.COM>
Source record: 234133
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 14, Info 1
Archive-name: intro

This is the first of three introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup. A companion
article lists all previously-published binaries, and a third article explains
how to retrieve and unpack binaries posted by others.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@panarthea.ebay.sun.com

--------------------

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@panarthea.ebay.sun.com. If you are on a UUCP-only site, you
can send them to {backbone}!sun!ebay!panarthea!atari-binaries.

If you're in Europe, you can send binaries to the European submoderator,
Jan-Hinrich Fessel, at unido!atari-binaries (or, if you're a masochist,
atari-binaries@unido.informatik.uni-dortmund.de.) He will test them and
forward them to me. Submitting to him saves net bandwidth, so it's
encouraged.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, software
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a
while.

Also, as of volume 8, I will only accept binaries packed with an archiver
for which source code is widely available. For the time being, this pretty
much means arc, zoo, and lharc. If you want to use a nifty new archiver,
make the source code available to the public (posting to comp.sources.atari.st
```

is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.binaries.atari.st: binaries and "information postings." They can be distinguished by the subject line:

Subject: v14INF2: Index and other info

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v14i081: deadwrtr -- Ouija-word processor

identifies this as the 81st binary article in Volume 14. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v14i041: zx81 -- Timex/Sinclair emulator part04/39

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: uuencode, 1meg, medium, high

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

uuencode - program is uuencoded (UNIX uudecode required to unpack)
uue - program is uuencoded (ST uud required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
lharc - program is an lharc archive (lharc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution

1meg - needs 1 meg of RAM

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: jackt@atari.UUCP (Jack Tramiel)
Posting-number: Volume 14, Issue 80
Archive-name: rsn

The "Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The "Reply-To:" header line in the article's main header points to the submitter, to make commenting about binaries easier.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

-- VOLUME 2 --

volume2/intro Introduction to comp.binaries.atari.st
volume2/Index Index of volume 1
volume2/stlist/part01 List of ST software titles
volume2/stlist/part02
volume2/stlist/part03
volume2/stlist/part04
volume2/stlist/part05
volume2/stlist/part06
volume2/stlist/part07
volume2/stlist/part08
volume2/abcd/part01 Alphabet game for preschoolers
volume2/abcd/part02
volume2/abcd/part03
volume2/arc521/part01 File archive and compress utility
volume2/arc521/part02
volume2/rsctoc/part01 Convert .RSC files to .C source
volume2/rsctoc/part02
volume2/1stw2ps/part01 Convert FirstWord to Postscript
volume2/1stw2ps/part02
volume2/1stw2ps/part03
volume2/icone2 Customize desktop icons (old ROMs)
volume2/animatic/part01 Demo of animation editor
volume2/animatic/part02
volume2/animatic/part03
volume2/animatic/part04
volume2/varlint C syntax checker
volume2/dcache Configurable disk cache
volume2/bubble/part01 Game: guide a bubble across a cave
volume2/bubble/part02

volume2/mg2a/part01 Emacs clone
volume2/mg2a/part02
volume2/mg2a/part03
volume2/mg2a/part04
volume2/mg2a/part05
volume2/startgem GEM autobooter for Mega ST ROMs
volume2/ccprint C source beautifier
volume2/flip27 Double-sided disk copier
volume2/poplib Shared libraries; popup menu example
volume2/arc521b Archiver (fixes bugs in 5.21)
volume2/hacman Game: chomp the dots, avoid the ghosts
volume2/unarc Fast unarchiver
volume2/scroll Fast screen scroller
volume2/asprite/part01 Sprite editor
volume2/asprite/part02
volume2/hdscan/part01 Hard disk utility program
volume2/hdscan/part02
volume2/hdscan/part03
volume2/diskscan/part01 Floppy disk organizer
volume2/diskscan/part02
volume2/diskscan/part03
volume2/break Exit programs with a keypress
volume2/monofont New monochrome font
volume2/arcgsh/part01 GEM shell for ARC
volume2/arcgsh/part02
volume2/astrocal/part01 Astronomical calendar generator
volume2/astrocal/part02
volume2/boggle/part01 Game: find words in a grid of letters
volume2/boggle/part02
volume2/frstprnt Print out First Word documents
volume2/afmt Disk formatter
volume2/cribbage/part01 The game of cribbage
volume2/cribbage/part02
volume2/timecode Determine 68000 code speed
volume2/staccato/part01 Music program
volume2/staccato/part02
volume2/staccato/part03
volume2/staccato/part04
volume2/staccato/part05
volume2/staccato/part06
volume2/spell/part01 Spelling checker

volume3/starchrt/part05
volume3/starchrt/part06
volume3/starchrt/part07
volume3/starchrt/part08
volume3/starchrt/part09
volume3/sttar Unix-style TAR utility
volume3/chekbook/part01 Checkbook manager
volume3/chekbook/part02

volume3/filespy Text file viewer
volume3/astro18/part01 Version 1.8 of astronomy program
volume3/astro18/part02
volume3/astro18/part03
volume3/d110edit D110 (MIDI synth) patch editor
volume3/shadopat.11/part01 Patch for Double-Click "shadow" program
volume3/shadopat.11/part02
volume3/shadopat.11/part03
volume3/shadopat.11/part04
volume3/dcfrmt30 DC Floppy Formatter 3.0
volume3/dcfrmt30 DC Format disk formatter v3.0
volume3/fsck Filesystem consistency check/repair
volume3/risk/part01 Game: take over the world
volume3/risk/part02
volume3/risk/part03
volume3/risk/part04
volume3/dcstuf09 DC Stuffer -- load more than 6 desk accs
volume3/nlqps2 Near-letter-quality printing (w/ font editor)
volume3/gstlink Faster linker for GST object files
volume3/arcgsh14/part01 Version 1.4 of graphical shell for ARC
volume3/arcgsh14/part02
volume3/vkill2/part01 New version of virus killer
volume3/vkill2/part02
volume3/vkill2/part03
volume3/tess Game: Beyond the Tesseract (adventure game)
volume3/mx2v230/part01 Multitasking kernel with utilities
volume3/mx2v230/part02
volume3/mx2v230/part03
volume3/mx2v230/part04
volume3/mx2v230/part05
volume3/gulam/part01 Command line interpreter and editor
volume3/gulam/part02
volume3/gulam/part03
volume3/gulam/part04
volume3/newword/part01 Desk accessory text editor
volume3/newword/part02
volume3/newword/part03
volume3/leolife The game of Life
volume3/limiter Limit uppermost hard disk device letter
volume3/sel_prog Miniature shell for launching programs
volume3/stdcat40/part01 Version 4.0 of disk catalogging system
volume3/stdcat40/part02
volume3/stdcat40/part03
volume3/gulam405/part01 Version 1.03.04.05 of GULAM shell
volume3/gulam405/part02
volume3/gulam405/part03
volume3/gulam405/part04
volume3/gulam405/part05
volume3/passm Logic circuit (PAL) assembler
volume3/sc_bin/part01 Sozoban C compiler binaries

volume3/sc_bin/part02
volume3/sc_bin/part03
volume3/sc_bin/part04
volume3/sc_bin/part05
volume3/sc_bin/part06
volume3/sc_bin/part07
volume3/dlibs12/part01 Library routines for Sozobon/Alcyon C
volume3/dlibs12/part02
volume3/dlibs12/part03
volume3/dlibs12/part04
volume3/gemfast GEM bindings for Alcyon C [v 1.2 in volume 5]
volume3/turtle30/part01 Version 3.00 of TURTLE hard-disk backup utility
volume3/turtle30/part02
volume3/turtle30/part03
volume3/turtle30/part04
volume3/turtle30/part05
volume3/turtle30/part06
volume3/turtle30/part07
volume3/jeflife Another game of LIFE
volume3/sort UNIX-style "sort" utility
volume3/1stprn16 FirstPrint 1.6 -- print FirstWord documents
volume3/shar Create shell archives a la sources group
volume3/keyfix Fix Gulam binary for non-American keyboards
volume3/bsdiff BSD-style diff (file difference) utility

-- VOLUME 4 --

volume4/micromix.ii/part15
volume4/micromix.ii/part16
volume4/mf_files/part01 Missing fonts from cm_mf
volume4/mf_files/part02
volume4/quikview Fast text file viewer/screen dumper
volume4/sokoban/part01 Game: slide blocks into proper positions
volume4/sokoban/part02
volume4/lambda/part01 Lambda-calculus interpreter
volume4/lambda/part02
volume4/lambda/part03
volume4/lambda/part04
volume4/lambda/part05
volume4/cpboot Copy boot sectors between floppy formats
volume4/du List disk usage in directory tree
volume4/fplib10 Floating point routines for Sozobon C
volume4/larn12/part01 Game: Find the magic potion in the dungeon
volume4/larn12/part02
volume4/larn12/part03
volume4/larn12/part04
volume4/larn12/part05
volume4/mouser Prevent mouse from entering menu bar
volume4/prtset Set up printer
volume4/quikinf Change DESKTOP.INF parameters w/o rebooting
volume4/quikfind Find files on your disks
volume4/giffer Monochrome GIF picture-file viewer
volume4/elan1v5/part01 Educational language system
volume4/elan1v5/part02
volume4/elan1v5/part03

volume4/elan1v5/part04
volume4/elan1v5/part05
volume4/elan1v5/part06
volume4/elan1v5/part07
volume4/elan1v5/part08
volume4/quikdex Rate system speed
volume4/quikinf1.1 DESKTOP.INF editor, version 1.1
volume4/zoo/part01 Superior archiving/compression system
volume4/zoo/part02
volume4/zoo/part03
volume4/zoo/part04
volume4/nutshell Get back to a shell from a GEM prog
volume4/tetris Game: drop blocks into place
volume4/deskset Reread DESKTOP.INF, set up system accordingly
volume4/newfonts/part01 More Metafont font files
volume4/newfonts/part02
volume4/newfonts/part03
volume4/newfonts/part04
volume4/newfonts/part05
volume4/newfonts/part06
volume4/newfonts/part07

-- VOLUME 5 --

volume5/dvist33/part01 New DVI interpreter
volume5/dvist33/part02
volume5/dvist33/part03
volume5/dvist33/part04
volume5/dvist33/part05
volume5/dvist33/part06
volume5/dvist33/part07
volume5/tetrix Game: drop the blocks
volume5/gnugo Game of Go (from GNU)
volume5/mx2doc/part01 Documentation for MX2 kernel
volume5/mx2doc/part02
volume5/printit PrintMaster graphics printer
volume5/viewit View PrintMaster graphics libraries [v2 below]
volume5/which Find programs using PATH env. variable
volume5/matricks/part01 Linear algebra (matrix) tool
volume5/matricks/part02
volume5/matricks/part03
volume5/gemfast12/part01 Version 1.2 of GEM bindings

volume5/gemfast12/part02
volume5/atime89 Set GEMDOS time from keyboard clock
volume5/viewit2 New version of PrintMaster graphics viewer
volume5/degasnap Save screen as DEGAS picture
volume5/noverify Turn off write-verify on disks
volume5/timedrv2 Clock set/drive display
volume5/quickst Speed up text output
volume5/dt Disk toolbox
volume5/quickrun Program selector
volume5/flex/part01 Lexical parser generator (= UNIX "lex")
volume5/flex/part02
volume5/flex/part03
volume5/minit928/part01 Terminal program with IBM-PC emulation
volume5/minit928/part02
volume5/minit928/part03
volume5/minit928/part04
volume5/minibbs/part01 Bulletin-board system
volume5/minibbs/part02
volume5/minibbs/part03
volume5/rsplot/part01 2-D plotting package
volume5/rsplot/part02
volume5/rsplot/part03
volume5/rsplot/part04
volume5/sysconf Boot configuration (AUTO, .ACC, etc.) utility
volume5/decky Connect a DEC keyboard to ST
volume5/quickst.12 Speed up screen output
volume5/quickdex.15 Version 1.5 of benchmarking program
volume5/gawk/part01 GNU awk clone
volume5/gawk/part02
volume5/quikfind.15 Find files on your disks, v1.5
volume5/bigscrn Create a huge virtual screen
volume5/rsflip/part01 Flip-book animation system
volume5/rsflip/part02
volume5/vkiller.220/part01 Version 2.20 of virus-killing system
volume5/vkiller.220/part02
volume5/vkiller.220/part03
volume5/vkiller.220/part04
volume5/flu Virus simulator
volume5/quickinf13 Version 1.3 of DESKTOP.INF editor
volume5/quicklabel Label-printing system
volume5/abe/part01 Another binary-to-ASCII encoder
volume5/abe/part02
volume5/abe/part03
volume5/abe/part04
volume5/filespy.12 Version 1.2 of text-file viewer
volume5/country/part01 Digitized country music
volume5/country/part02
volume5/country/part03
volume5/country/part04
volume5/country/part05

volume5/djreset Reset DeskJet Plus after powerup
volume5/modedit Hardwire an editor into German Modula-2
volume5/ff File finder
volume5/headstrt Boot GEM progs from AUTO folder
volume5/ratehd Rate hard disk speed
volume5/overscan Software driver for increased screen size
volume5/quickrun2 Run programs from a menu, version 2
volume5/folded/part01 Folding text editor
volume5/folded/part02
volume5/fmc Force media change on floppy writes
volume5/packer Make executables smaller
volume5/rename Rename disk files (text in German)
volume5/formdial Speed up dialog boxes
volume5/gnuemacs/part01 Full GNU emacs port
volume5/gnuemacs/part02
volume5/gnuemacs/part03
volume5/gnuemacs/part04
volume5/gnuemacs/part05
volume5/gnuemacs/part06
volume5/gnuemacs/part07
volume5/gnuemacs/part08
volume5/gnuemacs/part09
volume5/gnuemacs/part10
volume5/gnuemacs/part11
volume5/gnuemacs/part12
volume5/gnuemacs/part13

volume6/bstat/part06
volume6/bstat/part07
volume6/bstat/part08
volume6/bstat/part09
volume6/bstat/part10
volume6/bstat/part11
volume6/stdcat43/part01 Disk catalog program, version 4.3
volume6/stdcat43/part02
volume6/stdcat43/part03
volume6/flshcard Flashcard program for kids
volume6/gulaminf/part01 Documentation for gulam
volume6/gulaminf/part02
volume6/zoopolicy New copyright policy for Zoo
volume6/timedrv3 Display time and drive in corner of screen
volume6/boot Warm or cold boot from software
volume6/lharc2 New version of LHARC archiver
volume6/minit929/part01 Terminal program
volume6/minit929/part02
volume6/minit929/part03
volume6/greed Strategy game (more like a puzzle)
volume6/minibbs/part01 Bulletin board system
volume6/minibbs/part02
volume6/midinet3 Resident MIDI network notifier for minibbs
volume6/cat Replacement for gulam "cat" command
volume6/ps2form IBM-compatible formatter
volume6/protect Small virus killer/protection utility
volume6/atc/part01 Air traffic controller game
volume6/atc/part02
volume6/ff31 File finder, version 3.1
volume6/norad Earth satellite tracker
volume6/mandel Fast Mandelbrot generator
volume6/turbodmo Demo of Turbo-ST
volume6/opus22/part01 Version 2.2 of Opus spreadsheet

volume9/gnuemacs/part27
volume9/gnuemacs/part28
volume9/gnuemacs/part29
volume9/hospital/part01 Virus killer

volume9/hospital/part02
volume9/pyro Screen saver with fireworks
volume9/starstrk Screen saver with moving starfield
volume9/poolfix3 Version 3 of TOS 1.4/1.6 bug fix
volume9/imgcatj/part01 Print several .IMG files to a page
volume9/imgcatj/part02
volume9/lhx10 Extract/list LHARC archives
volume9/kbext414 Keyboard extender
volume9/file/part01 Determine types of files
volume9/file/part02
volume9/mdisk43 A ramdisk that looks like a floppy
volume9/quiklock Prevent unauthorized users from writing to disks
volume9/f77heap Change heapsize of Absoft Fortran programs
volume9/f77link Alternative linker for Absoft Fortran
volume9/splitit Split up and reassemble big files
volume9/wasy/part01 Symbol fonts for Metafont
volume9/wasy/part02
volume9/trees/part01 Fractal "tree" generator
volume9/trees/part02
volume9/trees/part03
volume9/newbell Replace the ST bell with other sounds
volume9/patience.eng/part01 Patch to PATIENCE card game for English-speakers
volume9/patience.eng/part02
volume9/arcgs21c/part01 Version 2.1c of GEM-based ARC shell
volume9/arcgs21c/part02
volume9/mx2net20 Filesystem sharing over MIDI/RS232
volume9/bgif Convert GIF to PI1, PI2, SPU
volume9/tport Transfer files to RAMdisk at boot time
volume9/abc/part01 Friendly interactive programming language
volume9/abc/part02
volume9/abc/part03
volume9/abc/part04
volume9/abc/part05
volume9/abc/part06
volume9/abc/part07
volume9/fft/part01 Perform fast Fourier transforms
volume9/fft/part02

-- VOLUME 10 --

volume10/amoeba.war Multiplayer Life-like game
volume10/abzmon Machine-language monitor
volume10/metaconv Convert EZDraw/UniTerm metafiles to GEM format
volume10/oatbran Screen saver, like 8-bits' attract mode
volume10/vault201/part01 Fast hard disk backup system

volume11/grep/part01 GNU grep and egrep
volume11/grep/part02
volume11/grep/part03

volume11/xpoolfix Fix a TOS 1.4 bug (NOT an official patch from Atari)
volume11/bomb Explain system errors
volume11/dviatari/part01 DVI previewer
volume11/dviatari/part02
volume11/dviatari/part03
volume11/sunclock A clock program...
volume11/geminiuk/part01 Gemini desktop replacement v 1.1 (English)
volume11/geminiuk/part02
volume11/geminiuk/part03
volume11/geminiuk/part04
volume11/geminiuk/part05
volume11/geminiuk/part06
volume11/mvdist/part01 GEMINI's shells (mupfel and venus)
volume11/mvdist/part02
volume11/mvdist/part03
volume11/mvdist/part04
volume11/altboot Select AUTO-folder programs/accs at bootup
volume11/nsyscom2 See GEMDOS/BIOS/XBIOS calls
volume11/aimps Convert AIM pictures to PostScript
volume11/patchtst Patch Turbo-ST 1.8 to work with DC Desktop
volume11/beep Replace bell with any sampled sound
volume11/click/part01 Replace keyclick with digitized sounds
volume11/click/part02
volume11/mines Game: get across a minefield
volume11/play/part01 Play digitized sounds
volume11/play/part02
volume11/play/part03
volume11/play/part04
volume11/ntplay Listen to Amiga Noisetracker/Soundtracker modules
volume11/belltest Belltest 2.0 -- test NewBell bell sounds
volume11/st_conc Concentration game
volume11/norad/part01 NORAD (satellite tracker) version 2
volume11/norad/part02
volume11/norad/part03
volume11/cmd Command line interpreter
volume11/pstfonts/part01 Three new fonts for PageStream
volume11/pstfonts/part02
volume11/pstfonts/part03
volume11/pstfonts/part04
volume11/pstfonts/part05
volume11/altboot3 Change auto-folder configuration, version 3
volume11/rhokontd Enhanced control panel (in German)
volume11/fastlife Game of life (not really fast)
volume11/sunclock2 Sunclock version 2 (WITH the .RSC file!)
volume11/djon DeskJet reset program
volume11/lharc1.02/part01 LHArc derived from UNIX version
volume11/lharc1.02/part02
volume11/coloremu Low-resolution emulator for mono systems
volume11/mediumem Medium-resolution emulator for mono systems
volume11/monoemu Monochrome emulator for color systems

volume11/meep Utility package for BBS-Express ST
volume11/mines Game of mines for monochrome systems
volume11/plot/part01 Function/data plotting package
volume11/plot/part02
volume11/plot/part03
volume11/dskswtch Load new DESKTOP.INF files without rebooting
volume11/switcher Pick random NeoDesk/DegaDesk pics, NewBell sounds
volume11/monoemu2 Another monochrome emulator
volume11/lgs1.7/part01 Little Green Selector file selector replacement, v. 1.7
volume11/lgs1.7/part02
volume11/dcopy3.6/part01 General disk utility
volume11/dcopy3.6/part02
volume11/stevie3.91/part01 vi editor clone, v. 3.91
volume11/stevie3.91/part02
volume11/stevie3.91/part03
volume11/maze Walk through a maze in 3-D
volume11/siren Sound an alarm to keep you awake
volume11/pinhead PinHead 1.7 -- speed up program loading
volume11/sunclock3 Another version of sunclock
volume11/nroff110/part01 Nroff clone, version 1.10
volume11/nroff110/part02
volume11/nroff110/part03
volume11/nroff110/part04
volume11/pi1tomon Display .PI1 pictures on a mono monitor
volume11/gulwrap Make Gulam work under Gemini
volume11/dublvis Format DS disks that work in SS drives
volume11/nrchbar Generate change bars for nroff files
volume11/sndshow3 Show DEGAS pictures on any kind of monitor
volume11/viewpic2 View a DEGAS picture on any monitor
volume11/mspeed Tiny mouse accelerator
volume11/rt_move Move files with right mouse button (TOS 1.4)
volume11/xmore Configurable "more" for various file types
volume11/mutate Disk sector editor
volume11/xxxx Insert numbers into files

Archive-name: unpack.cooked

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: December 31, 1990

A preliminary note, for those of you who know most of the
below already: the official archives on panarthea are NOT
reachable via anonymous ftp from the Internet. Read on for
information about accessing them by mail, or see the table
at the end of this document for a list of alternate archive
sites.

_1. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than
normal text. Usually, a binary that is posted to the net
will contain executable (program) files. Binaries are dis-
tinct from _s_o_u_r_c_e_s, which are the human-readable text files
that are interpreted by a computer and used to produce
binaries. Sources can be modified with relatively little
effort, and are usually pretty easy to read. Binaries are
not intended to be viewed by a human.

_1._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and
electronic mail) are not always capable of handling a pure
binary file. They are designed to handle textual messages,
and the odd symbols and characters in a binary cause them to
become confused, and often to mangle the binaries. To avoid
this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencod-
ing translates a binary file into text characters, so that
the news and mail transport programs won't mess up. The
disadvantages are that uuencoded files are about 30% bigger
than the raw binary files they represent, and that you have
to go through one extra step to get the binaries to work on
your computer.

_1._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work properly. The extra files might be data files, help files, or maybe some instructions for the user. In order to easily package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown

together.

To confuse matters even more, two new archive programs called "zoo" and "lharc" can also be used to achieve the same effect. Zoo is superior to arc in some respects, slightly inferior in others, as is lharc. Unfortunately, you can't unpack a zoo archive with arc or lharc, or vice versa (arc and lharc are similarly incompatible with each other.)

_1._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 45000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator

will usually post introductory articles, including a list of previously published articles.

_2. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week (usually much less) of the time they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site panarthea.ebay.sun.com has all the binaries stored in its

archives.

The other way to get binaries is to request them from panarthea's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you. One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

To find out more about the archive server, send a mail message containing the word "help" to archive-server@panarthea.ebay.sun.com. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@panarthea.ebay.sun.com to report the problem.

There are other archive sites, too, such as terminator.cc.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. Some sites, such as terminator, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp terminator.cc.umich.edu", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information. A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect. Note that panarthea does not offer anonymous ftp, as it's on a network that's segre-

gated from the Internet.

Panarthea also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of the archive-server's index files for the binaries and sources groups whenever new files are added. Note that if your site gets comp.binaries.atari.st, requesting autoindex is pointless and a waste of net bandwidth. Send mail to autoindex-request@panarthea.ebay.sun.com if you'd like to sign up.

_3. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple

_____
|- UNIX is a trademark of Bell Laboratories.

of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc on your Atari.

A version of uudecode written in ST BASIC is available in panarthea's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's _s_o_u_r_c_e_s and not binaries). Once you have that, you should get the files "arc," "arcdoc," and "uucode" from volume 1 of the binaries directory. They contain the arc program mentioned earlier, its documentation, and a much better, faster version of the uudecode program.

Use the BASIC program to uudecode the two encoded files; then use arc to unpack the better version of uudecode. (Arc is documented in "arcdoc.") Note that if you're reading news/receiving mail on a computer (such as a UNIX system) that already has uudecode, you can skip most of this; you will probably just want to uudecode arc there, then download it (using kermit, xmodem, or your favorite transfer protocol - consult your site's administrator and your Atari communication package's documentation for more information. Remember to use binary mode when downloading arc files!)

So far, everything has been small enough to fit in one piece, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source code, also suitable for compilation on UNIX systems, is

available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so don't give any of the parts the same name as the file that's being extracted from them!

On UNIX systems, you can also say (for instance) "cat part* | uud -" without renaming anything.

Using Binaries -5-

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass (with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files. Lharc is also available.

Most archives contain documentation; refer to the
instructions in a specific program for usage information and
the like. If you have problems with a particular program,
send mail to the submitter (listed near the top of each
part.) The moderator doesn't have time to become very fami-
liar with all the programs that are posted, so the submitter
will probably be much more helpful.

_4. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be
wrong. Mail servers usually respond to the word "help"
alone in a mail message. Some of the sites listed below may
not contain full archives of comp.binaries.atari.st, and
some may have other files.

2030. v05INF1: Introduction to comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1991-03-02 22:02:36 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <967@grapevine.EBay.Sun.COM>
Source record: 234136
Cross-posted to: comp.sources.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 5, Info 1
Archive-name: intro

This is the first of two introductory articles about comp.sources.atari.st.
This one describes how to submit source to the newsgroup, where the
archive sites are, and how to contact them. The companion article lists
all previously-published sources.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@panarthea.ebay.sun.com

--------------------

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to
atari-sources@panarthea.ebay.sun.com. If you are on a UUCP-only site, you
can send them to sun!ebay!panarthea!atari-sources. In Europe, send your
submissions to Jan-Hinrich Fessel, the European submoderator of the group,
at unido!atari-sources (or, if you're a masochist, atari-sources@unido.
informatik.uni-dortmund.de.)

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, source
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a
pain to separate them, and such submissions are invariably placed on
the back burner. Sources should be submitted in the same format as
binaries -- uuencoded arc, zoo, or lzh files. Please use Pierre Dumas'
"uue" program if possible, as it can correct some common transmission
errors. Split long submissions up into reasonable (less than 50K)
chunks. "uue" will do this for you, if you use "uue -700 file" to
encode.

Please inform me of any special system requirements, and what development
environment was used, so that I can properly test your submission and
label it when I post it.
```

Subject: The structure of comp.sources.atari.st articles

Each posting in comp.sources.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.sources.atari.st: sources and "information postings." They can be distinguished by the subject line:

Subject: v05INF2: Index for Volume 1 and other info

This first word in the title identifies this as the third info posting of volume one. Similarly, the subject line shown below:

Subject: v05i081: godsrc -- Universe simulator

identifies this as the 81st source article in Volume 5. Large sources are broken up into smaller pieces, and have subject lines that look like this:

Subject: v05i088: decbustr -- VMS clone in ST-LOGO, Part03/08

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: MWC, Megamax, 1meg, high

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

Alcyon - Alcyon C (included with Atari developer's kit)
MWC - Mark Williams C
Megamax - Megamax C
Laser - Laser C
Lattice - Lattice C
C - Any C compiler
OSS - OSS Personal Pascal
BASIC - ST BASIC (this is not a joke!)
uuencode - program is uuencoded (uudecode required to unpack)
arc - program is archived (arc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 5, Issue 80
Archive-name: micro-rtx

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Please try to use this name when requesting that sources be mailed to you. Also, note that the "part number" given in the title, and the archive name given in the auxiliary header need not be identical.

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do try to limit filenames to eight characters whenever possible, though.

Subject: Reporting and tracking bugs and patches to postings

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

Subject: Listing of archive sites in no particular order

1. Site panarthea is running an archive server, which automatically answers mail requests. Send mail to archive-server@panarthea.ebay.sun.com with the word "help" in the message body for more information. Both the sources and binaries groups are archived on panarthea.
2. Unido is the European archive site. It's running an archive server similar to panarthea's; send "help" to unido!archive-server for more information. Unido archives both the sources and binaries groups.

If you know of additional sites which reliably archive comp.sources.atari.st (or comp.binaries.atari.st, for that matter), please tell me so I can add them to the list.

I had the same problem about two years ago (caused by too much Dungeon
Master play I think) but my mouse was revived and is working perfectly
to this day.

Simply spray a VERY small amount of WD-40 on the top of the offending
micro-switch. Problem solved! {I have done this twice (once on my mouse
and once on a friend's which had developed the same problem). WD-40 is
an Australian product, but if you can find some stuff with a long, thin
applicator tube and advertising to the effect of "Starts Wet Motors,
Loosens Rusted Parts, Lubricates - Protects, Stops Squeaks" that might
be the equivalent in your country.

Hope that helps.

(This is not an advertisement.)

>

In practice, all the trap #1 calls seem to leave A0 alone (i.e. its value
on exit is the same as the value on entrance). However, since they are
documented as potentially destroying A0-A2 and D1-D2, relying on this
behaviour is *very* *very* bad and will break someday (as I've been told
when I've done this :-). Since new versions of TOS will presumably include
new versions of the desktop, I guess that is one application that can afford
to ignore this caveat; it is rather strange that it does, though.

2035. Revenge of the ST Fire Sale!!!

Newsgroup: comp.sys.atari.st
Date: 1991-03-02 23:39:56 UTC
From: lbert359@pallas.athenanet.com
Message-ID: <1010@pallas.athenanet.com>
Source record: 234122
Cross-posted to: comp.sys.atari.st,misc.forsale,misc.forsale.computers

Now that I have recovered from my December ST fire sale, I am ready to ply the waters again, so to speak. Thanks to all of you who made the prior sale a rousing success. I put some much needed cash in my pocket, and I hope each of you got something of value on the cheap.

I have a some items left from the previous sale, and I managed to dig up a few more interesting things since then. Most of these items are out of shrink wrap, so I cannot vouch for how they work. Here is the list:

Quantity	Description	Asking price (each)
1	Degas Elite	$5
1	SoftLogic Flight Simulator	$3
3	MaxPak Desktop Accessory package	$3
1	Michtron Time Bandits	$3
1	Data Pacific Translator	$25
1	Astra Two-Monitor Switch	$25
1	GST C Compiler	$3
1	Antic A-Calc	$3
1	Chat! (comm program)	$2
1	Michtron Juggler	$5
1	Z-time	$3
1	Printmaster	$10
1	Atari DBMaster One	$3
4	Antic Macro Mouse	$5
1	Beckmeyer Micro Make	$5
1	Beckmeyer Ansi Term	$3
1	Antic Flash (v1.12)	$2
2	Antic Shadow	$5
1	Midi Maze (neat game)	$5
1	Antic Red Alert	$2
2	Data Pacific Magic Sac	$10
2	Set 64KB Mac ROMS	$15
1	Megamax Laser C	$25
1	Timeworks Publisher ST	$25
3	Timeworks Wordwriter ST	$5

Books:

1	"Atari ST Explored," John Braga	$1

Start Mags with diskettes ($1 each):

2	Summer 87
1	Fall 87
1	Dec 88

2 March 89
1 April 89
1 May 89
2 June 89
1 July 89
2 Aug 89
1 Sept 89
2 Oct 89
2 Dec 89
1 Jan 90
2 May 90
2 June 90
2 July 90

Finally, I have various cases, RF shields, 520 motherboards, a 1040 motherboard, spare parts, power supplies, test kits, and schematics. If you are interested in the vagueries of ST innards and are happy with tearing into ST's with a scope and a soldering gun, this is the package for you. Call or e-mail me, lets talk. Call in the evening, unless you *like* talking to answering machines :-)

Generally I expect for you to pay for whatever you buy in advance. The way this worked on the prior sale was people e-mailed their requests to me, then I replied via e-mail with a purchase number, and set the appropiate merchandise aside. Folks wrote the purchase number on their checks, which they sent to me. When I received the checks, I sent the goods. I held on to the checks for about a week, then cashed them. This system seemd to work pretty good. I did send a few things C.O.D., but this costs more. Generally I need about $3 to cover UPS/USmail charges. So, tally up the price of all the goodies you want, then add $3 for shipping.

E-mail or call!

I think your first request on a 68010 is OK, but I find a 68000-16Mhz perfectly fine. And I think that is a good new base for a low cost machine for wide appeal.

A co processor for the low cost machines is not an issue I don't think as most people who buy them, aren't going for math intensive operations.

I think 2 megs is a good start on any base model.

As for the operating system, Wow you really blew it there. Who wants MiNT or TOS when UNIX/X-Windows is available.

I already have an AppleTalk caompatible port on my machine so I think ATARI is working toward the right direction, also Mr. Small has hardware you can addt to get really high performance network hardware. There are TCP/IP drivers acrd hardware you can buy now too that you can add on.

For video output, I agree. atari should be putting out 640x480x16 color machines as the new base for video standard. 640x400 kinda sucks, but one can certainly live with it.

Message-ID: <1991Mar03.003414.4410@chinet.chi.il.us>
Source record: 234147

I have a different wishlist. I'd stick with the 68000 for a 'super-ST', in part because there really would be applications broken by the hardware differences. I'd like to see available memory increased to 16 MB, with the starting configuration about 1 MB. A megapixel monochrome mode and something around 640 x 400 x 64 colors from a large palette would be nice for video, and it would be cost-effective to tune the details so they could run on popular multisync monitors. It would be VERY nice to see TOS re-done to include the best of the extensions (or at least the best of the PD extensions). I'd like the developers' compiler to be GNU C, with Atari-developed libraries so it wouldn't be necessary to link with GNU libraries. If at all possible, I'd like 1.4 meg floppies and a built-in rudimentary PC emulator (or some kind of Atari-label PC emulator). I have the highest regard for suppliers of host adapters, but Atari should put a Mac-style SCSI port on the machine (as on the TT). Room in the box for a hard disk, and a way to support virtual memory would be nice, but a built-in hard disk and VM out-of -the-box don't sound like basic features (I know VM with a 68000 requires hardware support--still sounds better than going to a 68010). I'd consider 16 MHz the minimum acceptable speed for a brand new machine, and would like to see more. Networking needn't be built in, but again, should be available with Atari label accessories, and compatible with SOME standard that's out there already.
Basically, I thing the Mega STe is a great beginning, but only a beginning.

Steve saj@chinet.chi.il.us

> for filenames.

What did you use to format the disks? If you use some super deluxe whizzo
formatter, it's possible that the formatter doesn't put a proper volume
serial number on the disk, and that the machine therefore didn't notice
the disk had been changed.

mathew

Yes, I think that is the hardware problem he's referring to. At least, when I got my first STe, I had to return it for another because my hard drive just would not work with the original. I was told that the problem was a flakey DMA chip (made by IMP, I believe). By the way, did Atari fix the problem by going to another manufacturer or did they get a remedy with IMP? Just curious ...

This is a reply to whoever wanted to set the modem port speed above 19.2K

There is a program from a German developer called HSPD_232.ACC (file size
under 1K) that does this for you. It turns on the handshaking and sets
bps rate to 38400, 76800, or 153600 (the last setting is only possible
with an accelerator board installed - it says in the docs)
The programmer's name is G.Mester

Buck Godot asks:
>I heard that there is a Dungeon Master saved game file with Bloom County
>characters. Cananybodyhelpme out?

Not for Dungeon Master, but one of the added features of Chaos Strikes Back
(the sequel to Dungeon Master) is the ability to edit the Champions'
portraits.. and there does indeed exist a set of Bloom County characters
for use with CSB.. (Opus, Milo, Steve and of course, Bill the Cat).

Let me know if you want them...

BobR

> Andy Gray andy@jarthur.claremont.edu

Andy,
I'm not sure why, but the Macintosh port of Oberon demands a 68020. I d/led it for my Mac+ (with 4MB) and was surprised that it wouldn't work there. I went and ran it on a Mac II (68020) at school, and it looks very interesting. The only problem seems to be the 68020. Perhaps someone with Mr. Small's 68030 board could take a look at MacOberon, and see if it runs on that platform. (As an aside, I was also frustrated when I found out that MacOberon demands a control key as well, so even if I got a 68030 accelerator for my Mac, I still couldn't run it, as I don't have a control key...8( )

My ST COULD run it, I suppose, with Mr small's board....*sigh*...maybe he OUGHT to consider the idea of bringing his own machine out, with the best of both worlds. At least, he could do no worse than these other companies...

Ah, you should have mentioned MGR sooner. I wrote a small dumb-terminal program for MiNT; it works fine with the vt52.prg supplied with MGR. I called it "tip" and modeled it after the BSD tip program. I posted it a while back with my rmgr sources, it oughta be on atari.archive.

I hate to disagree with you, but you're wrong about this...

>One of the timers in the MFP is used to generate the send and receive
>clock for the serial interface. Using the standard clock frequency and a
>pre-divider by four (this is necessary for async. operation) it can
>generate clocks up to 19200 Baud.

Actually the predivide is by 1 or by 16, with div 16 for async and div 1 for synchronous modes. However, even tho div 1 is meant for synchronous comm., the MFP will operate asynchronously with this setting. Unfortunately, the crystal frequency is so bizarre that 38400 is the highest "standard" bit rate you can coax out of it. (2.4576MHz.) You can set the counter for 76800, but I've not tried it, I'm sure it would fail miserably. I got a lot of noise running at 38400 between my ST and a NeXT box. Of course, I haven't tried between two STs yet.

Someone else commented to me (sorry don't remember, this was a while back) that there's no way you can get a consistently good signal using this trick, because the MFP is struggling so hard to detect the pulses at these speeds. So, if you're really serious about it, you're probably better off doing the hardware mod.

I wonder how he's deciding that limit - CPU response time? The timer
values can be set for 307200. Other interesting values: 122880, 61440, 30720.
Not very useful, except maybe between two STs.

UNIX/X with 68010 and only 2 megs would be an incredible dog. 68030 with 4-8 megs would run UNIX/X tolerably. Maybe Mach would be a better choice, I think it is on its way to being PD. Throw NextStep on top of that, and it would be really cool.

Rick Silverstein asked about the end of Level 4 in Dungeon Master...

There's a trick you can use to help eliminate the hordes of Purple Worms at the very end of this Level...

DON'T break down the wooden door past the "Prisoner", so the worms can't get to you... then kill the mummy with whatever, and wait across the pit from where he was... the Worms will wander out into that space, allowing you to hit them with Magic, arrows, rocks, whatever you happen to have...

If you're lucky, you can eliminate most of them without their ever even being able to attack you... then you can go in, break the door and mop up the leftovers.. The long corridors lend themselves to an "Attack and Retreat" method of fighting the worms until you get back to a wider room where the "Dungeon Master 2-step" becomes effective...

The other stairway, near the Screamer Room can ONLY be opened from the Level below... it becomes part of a "shortcut" back to the Screamer Room, which is an important source of food...

Just to expand on what Darek posted about the Windsor/Detroit Atarifest, here's the "official" Press Release that was just, er.. released...

Atari Users' Groups in the U.S. should have already received an information package detailing how they can arrange for a FREE booth at the show to represent their group. Canadian groups should be receiving the same info as soon as the Canadian WAUG sends them out.. :)

FOR IMMEDIATE RELEASE -- February 1991

Ann Arbor, MI/Windsor, Ontario, Canada -- The Windsor Atari Users Group of Windsor, Ontario, Canada and the Washtenaw Atari Users Group of Ann Arbor, MI are hosting the Windsor/Detroit International AtariFest on May 4-5, 1991 at the St. Clair College of Arts and Technology in Windsor. With support from both Atari US and Atari Canada, the show promises to be a "must attend" event for Atarians everywhere.

St. Clair College is conveniently located in Windsor, only minutes from the Ambassador Bridge and Windsor International Airport. Hotel accomodations, car rentals and a number of restaurants are also near the college. Regularly scheduled flights are available from Toronto to Windsor, and charter flights are available from Detroit Metro Airport.

Exhibitors already committed to exhibit at the show include:

Atari US Atari Canada Branch Always Software
Canoe Computer Channel One Computer Clear Thinking
DA Brumleve Double Click Software Fast Technology
Goldleaf Publishing ICD Inc. Innovative Concepts
ISD Marketing Joppa Computer Mainstream America
MegaType Micro Creations Musicode Software
Nice & Software PDC Distributors Phil Comeau Software
Talon Technology Unicorn Publications What's This?
Wiz Works

Many other developers, including GEnie, Soft-Logik Publishing, Gadgets by Small, Michtron and CodeHead Software have indicated interest in exhibiting at the show.

Show times are 10-6 on Saturday and 10-5 on Sunday. Tickets are only $4 Canadian per day at the door, and children under 12 will be admitted free of charge when accompanied by an adult. Door prize drawings and seminars will be held throughout both days.

Advance tickets can be purchased for $3 Canadian (or equivalent US exchange rate) by sending check or money order to Windsor/Detroit International AtariFest, 3487 Braeburn Circle, Ann Arbor, MI 48108.

For attendees flying in for the show, Northwest Airlines is offering 40% off round trip coach airfares and 5% savings on other applicable round trip fares. Canadian attendees can save from 25 to 40% on coach fares. Call 1-800-328-1111 for reservations. The "profile number" for the discount airfares is 03257. Northwest Airlines is the official airline of the Windsor/Detroit International AtariFest.

Special show discounts on car and truck rentals is available from Budget Rental, the official car rental company for the show. Low convention rates are available on everything from Ford Escorts to Lincoln Town Cars. To make your reservation, call 1-800-333-8840, identify yourself as an attendee of the show and give them the "rate code" of CNVNR1.

For more information on the show, contact Craig Harvey, President of WAUG - Ann Arbor at (313) 994-5619 or Brian Cassidy, President of WAUG - Windsor at (519) 966-0305. Developers interested in obtaining booth space at the show should contact Pattie Rayl at (313) 973-8825 ASAP.

2059. Dungeon Master Music CD

Newsgroup: comp.sys.atari.st
Date: 1991-03-04 00:06:26 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <39789@cup.portal.com>
Source record: 234012

For all Dungeon Master fans, FTL has released an audio CD of Dungeon Master background music to set the mood for those long sessions in the Dungeon..

It's a sort of "new wave" style, somewhat reminescent of Tangerine Dream..

Sample titles from the tracks: "Into the Dark", "The Adventure Begins", "Choo Your Fate", and "Chaos!"

"Dungeon Master, the Album" is $15 from Software Heaven, 6160 Lusk Blvd., Suite C-206, San Diego, CA 92121

(I got mine at an Atari dealer during the summer, but they're available direc from FTL now...)

2060. LDW problem

Newsgroup: comp.sys.atari.st
Date: 1991-03-04 02:11:51 UTC
From: rotary@blake.u.washington.edu
Message-ID: <17575@milton.u.washington.edu>
Source record: 234145

Hi. Can someone please help me?

I have read the LDW Power manual and recently bought a Lotus 123
manual. I still, however, cannot seem to get what I need out of the
program!
Please let it not be ignorance/stupidity
PLEASE HELP ME!

My 'basic' data base looks as such:

Apartment # Name January February ....

1 Mary Lou $OO.OO $00.00
2 Joe Blow $00.00
3 Dixy Ray $00.00 $00.00
.
.
.

My Input Range (Reciept Format) is:

Apartment # : 2 Name : Joe Blow

Rent Amount : $300.00 Rent Being paid : $250

Month : FEBRUARY

I have it access the Apartment # and fill out everything else (name,
rent amount, ...) in the input range except the "Rent Being paid"
which is where the problem is.

I would like the "Rent Being paid" amount, in this case $250.00,
to be updated in a specific cell in the Data Base.

Apartment # Name January February .....
1 Mary Lou $00.00 $00.00
2 Joe Blow $00.00 (RIGHT HERE!!)
3 Dixy ray $00.00 $00.00

Obviously in a much larger Data Base I cannot and will not
go and find the address of such a cell.

I can have LDW use the @HLOOKUP function to find a value in the right
cell but I cannot seem to access the address using this function or
any other function. This would enable me to use the address and copy
the contents of Rent Being paid into the appropriate cell.

This seems like a very simple thing for a spreadsheet to do but
I probably will go bald becsause of all the hair I have been pulling
out of my head!!

Any help would be Greatly appreciated.

Jake D.

>Your Fate", and "Chaos!"

Sounds interesting. Anyone know of plans for a cassette version?

I'm also glad to hear that FTL is still alive and kicking (somewhat,
anyway). So what's their next ST game project and when can I buy it? If it's
as good as their previous efforts...

--R.J.
B-)

P.S. Then there was the rumor that FTL would adapt DUNGEON MASTER to the
Atari Lynx. Just think, each player gets their own first-person perspective
on the hunt for Chaos...

Ah, memories. The nightlite hardware was a generic box that had a bunch of RS232 lines and a cpu and a little program. You could then convince it to multiplex many slow lines into one fast one, and plug that into your ST. I thought about doing a OS9 driver for it, but getting it to do anything like interrupt-driven I/O must be nasty. And the software in the box had to be really robust or it would have big problems. The only BBS I used that had it was stable, but it was the owner's machine.

DC's solution sounds much more robust and easy to deal with.

2064. reset

Newsgroup: comp.sys.atari.st
Date: 1991-03-04 05:59:31 UTC
From: ljdickey@watmath.waterloo.edu
Message-ID: <1991Mar4.055931.10204@watmath.waterloo.edu>
Source record: 234017

In February, a program called RESET appeared on the net.
It allows the user the choice of a warm or cold reboot from the
keyboard. I could see some use for this, and so I tried it.

Sadly, it does not work on my system, and I wonder if anyone else
has tried it out and found it to not work on their system too.
Just for the record, "tosvers" by Rainer Klute shows

TOS version: 1.2 (22.04.1987, "BLiTTER TOS")
GEMDOS version: 0.19
AES version: 1.32

What has your experience been with "RESET.TOS"?

2069. ST peripherals - UK versus US

Newsgroup: comp.sys.atari.st
Date: 1991-03-04 11:16:23 UTC
From: SAMcinty@exua.exeter.ac.uk
Message-ID: <1185@exua.exeter.ac.uk>
Source record: 234041

I recently purchased a STE from a company here in the UK, but
have also noticed that the going price for my system in the States
is about half as much....

The main damage is done, but I am going to be in the market for
hard drives, printers, etc, and the more I look at the prices here,
the more flummoxed I get!

The typical 24 pin printer is about #259 (give or take a bit) which
translates to nearly $475!!!!!!! Seems outrageous...especially
the hard drives, going price for 40megs is #350, which is nearly
$700 US!

I know that the Atari ST market is supposed to be big in Europe,
especially Germany, so is it possible to purchase things from
the Continent without paying customs out the wazoo?

I am planning a trip to the us in about a year, should I save up all
my wants and get them then and just smuggle them back into the UK?

Is there ANY hope for someone like me, a student with a limited
income and high computer aspirations?

I would appreciate replies from ANYONE who can help, here in the UK
or other wise...

Oh, software, there's a good one, the typical program like Word Perfect
goes for about #250 mail order, which is about $475...I don't think
that it can be that expensive in the States!!!

Help!

Scott

>enough :-)
>
>Andy
>

Where is the resistor for?

I like to update my 520+ (1MByte, officially piggy packed by
Atari Benelux) but I found one problem.

I bought the Xtra ram 2.5 MByte update, which includes descriptions
for all kind of difference versions of 520/1040/MegaST, except for
mine. I think this is because the 520+ was not sold in GB where
Xtra ram comes from.

The problem I have is that the documentation described about
disconnection two resistors and connecting them to some capicitor
in the edge of the PCB. But I do not find these resistors.
I found that the CAS and RAS lines (3 wires) are directly coupled
from the RAM pins to the MMU.

Although the Xtra documentation is very good in "what to do", however,
it doesnot say "why". For this reason I'm not sure what to do, and
I certainly donot want to blow any of the expensive chips (like MMU).

Any help?

Thanks.

>1. It should contain a 16 MHz 68010 (at the least) so that virtual memory
>can be implemented.

Does a 16MHz one exist? I don't see it mentioned in the 68000 family reference from Motorola. You could DMA the virtual memory with a little extra wiring. The MMU has to generate BusErr for CPU and DMA pagefaults alike, and the DMA pagefault puts DMA on hold until it's been fixed up. Any time-critical DMA transfers will have to be page-aligned.

>2. It should contain software drivers to emulate (and a socket for)
>a 68881/68882.

This could be made available as an upgrade. Does anyone have any ideas about plugging non-standard hardware boards into Blitter/Glue/MMU sockets? Where are the connectors available from? Of course it's a good idea to include FPU emulator code as standard.

>5. As an operating system perhaps a combination of TOS 1.4 and MiNT
>would be ideal. Any part of TOS that isn't implemented in MiNT should
>be added onto MiNT (or the other way around, whichever you prefer.) and
>then stuck into ROM. Also the standard C libraries should be ROMed so
>that when you start multitasking each program won't require it's own copies.

Try starting with TOS 1.62, that has built-in support for all the 680x0 CPUs. C libraries can be shared in RAM too. All you need to define is a common access interface. Any OS should be _general_purpose_, and fully extendable. C libraries don't really belong in ROM because not everyone uses C. A better idea would be general purpose high-level libraries in ROM.

The standard video drivers (low-level as well as GEM) should be dynamically configurable for any type of screen. Screen RAM could be overlaid in the ROM space so there is less bus contention with the video. The ST memory map allows for up to 2MB of such RAM (less 32k of hardware registers). The design of the screen hardware should allow for removal and exchange of hardware shifters on a modular basis. People would then be able to choose the right screen modes for their own use and not have to pay for megapixel colour if they only want minimal monochrome. The whole ROM space (2MB less 32k) should be available on the cartridge port so that TOS (or whatever) can be replaced on a cartridge module.

>
>I have a different wishlist. I'd stick with the 68000 for a 'super-ST', in
>part because there really would be applications broken by the hardware
>differences.

A 68010 can emulate the 68000 except for cases where cycle timing is crucial. I'll not lecture on how bad reliance of code on cycle timing is, because you've heard it all before anyway. If you really need 100% 8MHz 68000 ST compatiblity you could have one in there too (piggybacked optional extra :-) so that you can switch between it and 16MHz 68010.

I'd like support for 1.4 and 2.8 meg floppies to be in the OS and for the upgrade to be as simple as swapping chips. PC emulator should be software bundled with the machine, with the option of upgrading to V30 or SX386 slave boards *[* with their own memory space *]*

What are people's ideas about PD hardware?

Enough of my opinions for now,

Me too, me too!
Sorry for crying so loud, but my mail bounced, too.
Nevertheless, Bill's upgrade seems to be a really cheap alternative
to the common DRAM-based memory upgrades I know of, therefore there
should be some public interest.
Thanks in advance,
Wolfgang

I tried to use this program also, but it is not very stable. I would recommend purchasing Universal Item Selector III, as it provides this feature, and seems to work about 99% of the time. Heck, this program is a must have anyway. It can be had for about $15, worth every penny. I also have TOS 1.2 by the way, and the keyboard reset from UIS3 works fine.

Source record: 234029

A lot of spectrum 512 images were recently uploaded to atari.archive. Unfortunately, a lot of those seem to be corrupt. While you don't get much in the way of compression, I'd suggest that future uploads be arc'd some way or another, just to get the CRC check on the data. (You can use the (s)tore option in ARC to store a file without compressing it, if you don't want to wait for the compression algorithms...) Or we can adopt the crc program that is used to check Minix source code postings and such, since that's really all I'm asking for. Then when you upload any non-arc'd files, you can send the CRC values along with their names in your notification messages.

You have to completely surround him with the flux cages. Putting one
directly on top of him has no effect. Once he's completely surrounded, you
just use the FUSE option on the firestaff to finish the game.

One thing to remember re: 68010 is that Motorola appears to want to phase it out soon. They've always had problems with the part in terms of production yield and performance. (no, there is no 16mhz 68010). The rumors I've heard are that Motorola is trying very hard to convince the few designers still looking at the 68010 to switch to the 68020 instead, to the point of pricing the '20 below the '10. IMHO this is the right way to go. Especially if the price is comparable, the 68010 has NO advantages over the 68020.

>printer options are either a Star LC-10 or Apple LaserWriterII (post-
>script).
>
>Kevin Harris.

You may find that that you will have two problems:

1: Any "decent" PCB software that will do autorouting may be out of your
price range (i.e. >$800 US) and that any that do autorouting are good
for only LOW speed LOW impedance digital work... I wouldn't trust any
autorouting prog for analog and/or wide bandwidth boards...

2: If you wish to make your boards "in house" or have a firm manufacture
your boards, you will find that your artwork will not be adequate:

either send your file off to a place that can make GERBER
photo-plots OR capture your postscript output and take it
to some place that has linotype (preferably a linotronic
300 or better)...

If you try to use the artwork from a laserwriter you will find two
fun flaws:

1: there is enough error (x-y) on the laserwriter's output
(over a large area) to say that it isn't truly WYSIWYG.

2: The ouput from a laserwriter is not very opaque at all!
It turns out to be fairly unreliable for any traces
smaller than 0.030".

And dot matrix? ya' gotta be kidding!

email me with any questions...

p.s. my disclamer doesn't apply here...These are the opinions/findings
of both my boss and myself.

Who uses MiniBBS BBS-system ?
"""""""""""""""""""""""""""""

I have a little problem that YOU can help me with !!!

I am the one that makes the MiniBBS Public Domain BBS-system,
and during the last year many ST-freaks have asked for the
program, and many uses it to run their own BBS'es.

The problem, however, is: I don't have a list of them !!!!
""""""""""""""""""""""""""""""""""

So could everybody that either uses the MiniBBS program to
run a BBS, or knows about a BBS running MiniBBS software
please send me a letter with:

BBS-name, SysOp name, full adress, phone (both data and voice)

If I get all this information I can compile a user list and
send out new versions of MiniBBS and other information !!!!

>>S.S.

Don't believe everything you read, especially about Atari bundling stuff
with computers for free and providing upgrades for free. In my *personal*
opinion, it is unlikely, but I don't make marketing decisions around here.
This is a No Comment on the subject on the emulation software itself --
that's not my department either.

>Considering that 25 Mhz, 68040 in NEXT emulates an PC AT at 12 Mhz, '030
>emulating it at 12 Mhz is pretty good.

A TT version wouldn't have Mach to contend with. Clock-time for running a
program (as opposed to CPU time) could be faster on a 32MHz '030 with TOS
(read: essentially zero OS overhead) than on a 25MHz '040 with Mach (read:
UNIX).

I find that hard to believe in. Why would Newtek want ST market? There are even fewer STs on professional use than Amigas. I don't think that Toaster will ever be reconstructed to any other machine but Amiga 3000 since they won't even reconstruct it for IBM PC or compatibles. The reason is simple: Amiga is most suitable for videowork of all major personal computers (well, NeXT may be as good as Amiga). Toaster for ST/TT is reality only in your imagination. And will be.

>multitasking each program won't require it's own copies...
^^^^^^^^^^^^

I think you mean multiprogramming. Multitasking alone doesn't imply separate images. Even with multiprogramming, the 68881 can handle shared segments, if the library and OS collaborate appropriately. Multics could do it in '68, so why can't Unix do it now? (Actually Mach can).

Where? I got mine at my local dealer for $17. This was more than a year ago.
The package retails for $30. Yes, for BOTH programs. :^)

You can get it directly from Strata Software, but I don't have the address
with me as I'm not at home. (I should carry such info in my wallet, right?) :^)
Eric Rosenquist, or someone else, should have the address. Mail order
houses should have STalker/STeno too.

Well, for one, the ATARI TT/030 is opening up new markets for ATARI.
As you might know, Europe, and Germany in particular, is loaded with
ATARIs, not AMIGAS.. perhaps the third party co that is doing the
marriage between the Toaster and the TT is shooting for that market.
In any event, NewTek is cooperating with the port.

Why are Amiga owners threatened by the possiblity that
the Toaster might be running on another platform?
Does this make the Toaster running on the Amiga any less
useful? I don't get it?

If someone is wants go buy an AMiga, they will buy it.
If someone wants to buy a TT and a Video Toaster, they'll
buy it. And everyone can be happy. I really don't see
why Amiga owners don't want to see hardware developed for
other machines. It is a very strange concept. I use NOTATOR

on the ST.. i wish it were running on Macs and AMigas..
just so that friends, who own these other systems, and I could
share music a bit more freely.

Are mac people freaked out that Aldus ported Pagemaker to MS-dos?
Should ST people be freaked out that PageStream was ported to the
Amiga? I honestly don't care?.. if anything, am pleased that
AMiga owners have the option of using PageStream if they choose.

Still don't get it..

Well, for us lowly ST owners, it has one advantage - pin-compatibility with the 68000. Although I guess even that's not true for all the 68000 package configurations now. (Which kinda sucks for us STe owners, where TOS 1.6x can cope with the 68010 but you can't get one in the proper packaging/pin configuration. What a drag... [Hm. Why doesn't someone market an adapter socket or something? Sheesh!])

Back to the wish-list... How 'bout some dual-ported RAM, none of this Video-always-wins bus hogging. I don't really understand what's going on in the video hardware, obviously. Why does the video need to run at 16MHz to produce an image on a 15.75khz display? What's really going on here? I've seen mods that use an additional shifter chip to extend the pallete. How 'bout doubling the clock rate on the shifter so we can get more resolution? How 'bout giving us 8 or more bitplanes instead of just 1, 2, or 4?

Ok, moving right along... DRAM is pretty cheap now, even at reasonably fast speeds. Why did the Mega STe require caching for 16MHz operation, why doesn't the entire system allow normal accessing at 16MHz? Double all the relevant clock rates, while you're at it - DMA bus, for example. I wonder how long it'll be before we see an even faster version of the TT. (Ok, so ya can't run at zero wait states with a 50MHz 68030 using human-priced DRAMs. But it'd be nice to head that direction, eh?)

Speaking for myself, the point I was making was that this story is more than a little incredible. Considering how militant NewTek is concerning the Amiga, and the way they stiff-armed IBM and Apple (story was that Sculley was very angry after he learned NewTek had no intention whatsoever to move the Toaster over to Mac), it is hard to believe that suddenly they have decided to support a much smaller market than those mentioned above. Irregardless of the ST/Amiga debates, the reason the Toaster is on the Amiga is because it uses/needs the custom chipset of the Amiga. It is not just a plug-in peripheral that can be adapted to any host just by modifying the form factor or some connection changes. Seeing as how the vast majority of ST's have been sold with no form of expansion bus (unless you count the cartridge port) this makes it harder to understand how this device will be transferred over. The re-engineering needed to do so would seem to imply it will be longer than "within the year." But, I defer to any EE's who will claim otherwise. :^) Also, it needs at least 5 megs RAM, and current ST's (not the TT, of course) are limited to 4 megs (unless you go on the Mega expansion bus- don't know if anybody has done this or not.) If we are speaking of the TT, then I would have to say the existing installed base of TT's is most likely not large. I don't think I am being unfair when I say this.

Anyway, it would be neat if the ST also got the Toaster. For reasons I have listed, it seems unlikely to me. In light of the attitude and mud-slinging the Lexicor man did, it seems even less likely this is the case. (In fact, this is the main reason why I think this is a false rumor.) But stranger things have happened, and if it indeed comes out for the ST, then that will be very good news indeed, because this is a very powerful peripheral. If sombody wants it bad enough, they'll do it.

Dave

Wow! Those prices are outrageous! A 100 meg drive can be had for
$399 these days if you look around (that's a bare drive). I sort
of remember looking through a UK ST mag and getting excited at
the low prices and all the support. Are we thinking of the same
UK???

What about Intels DVI for the PC. I attended a Developers
Workshop for DVI this Fall. The hardware seems so much
more advanced than what the Amiga provides (at least from
the video tape they sent me). DVI allows you to author
video on a CD - WITH COMPRESSION! It provides all the
special effects, output options, etc...

The Amiga is impressive, but I think I'll wait until I
can afford DVI - it is just so much better.

Unfortunately the Toaster does not support PAL (the European standard) video signals, so it would be rather useless for companies there to spend a lot of money on a machine which will be basically useless in their countries except for its frame buffer capabilities, which can be had 'standalone' at a much lower price.
As far as the # of Ataris vs. Amigas in Europe, I've heard several figures lately that would seem to argue in favor of the Amiga. Namely, a british computer magazine listing the top 10 computer companies (in units shipped) which went something like this:
1. Commodore
2. IBM
3. Compaq
4. Atari
.....etc

Also, Commodore's profits in the past two quarters have been extraordinarily high (for Commodore), and according to the quarterly report they send to stockholders, this is due in large part to something like a 50% increase in Amiga sales. As of last year around the time the 2 millionth Amiga shipped, 75% of those were in Europe.

>Why are Amiga owners threatened by the possiblity that
>the Toaster might be running on another platform?
>Does this make the Toaster running on the Amiga any less
>useful? I don't get it?
>

Probably because the Toaster represents a very key product on the road
to professional respectability for the Amiga, and Amiga users need to hold
on to anything that will be helpful in that area. To have it ported to
another machine, whether it be ST, PC, Mac, or other, takes that edge away.

>If someone is wants go buy an AMiga, they will buy it.
>If someone wants to buy a TT and a Video Toaster, they'll
>buy it.
>

Err, if they can find one, that is (the TT _or_ the TT Toaster) :-) :-)

Out of curiosity, is SoftLogik still providing PS upgrades? I've been using
the Amiga v2.1 and am pretty impressed with it.

You sound like a amiga user, very much indeed, if you find something hard to bellieve,
is the problem with your/somebody else's imagination or what ?!?

Fewer st/TT:s in prof use than amigas?
how many european BIG TV companies can you name using amiga solely for their
very professional genlock work ? (like logo's , add's etc.)

Tele-5 in germany (approx. spred 52 milj.people) has used good old st for it,
as well as for other applications (texting etc.) and they're now mowing to TT
and said it's a hole new world !!!
- and ONE OF THE REASONS FOR TT INVESTMENT BEING THE VIDEO-TOASTER
-If you can get a copy of 2/89 of the 68000'er magazine, start reading from
page 42 and find out that many things that A3000 does with Vid.Toast... are,
and have been done with st and specially customised programs for years !

But the fact is:"If you can shape it in your mind, you will find it in your TT"

Followup to: alt.flame

Why is it that once a month some poor unsuspecting person asks the net to
compare a feature on machines X and Y and this generates tons of replies?
Some of the replies are concise, factual, and unbiased. Most are suitable
for Flame Wars use only. And after a few days of these start the posts that
say to stop posting the flames.
Isn't there some way to circumvent this procedure - like having a
group called alt.computers.comparisons or more in line with what gets sent
alt.computers.mine.is.best ?
This is most true for the three 680X0 based types that this is posted
to. I don't see why there needs to be such fierce competition and flaming
between these machines. They all do about the same thing in about the same
amount of time. The low-end ones have equivalent processors and clock speeds.
The high-end ones too. They all have keyboards and mice standard. They have
varying sound and graphics, which is where most of the flames get started.
A lot of articles start out with the popular "IMHO". Not when
comparing computers!!

Until the next round of idiocy...

This is just from memory, but I think each icon takes up about 300 bytes
of RAM. I can't remember reading anything about a limit, other than of
memory, although there *is* a limit on the number of icons which can be
placed on the desktop. I don't remember what that is, sorry, but it's
been increased for version 3.

Hi there,

I'd like to here from someone who has got G++ running on there machines. I've had a look at the files on terminator and there appears to be a total lack of README files. I assume that one of the TTP files takes a C++ progam as input and outputs a C program. What I'd like to have running is the gnu C++ translator and Lattice C to do the compilation. Has anyone got a setup like this? What libraries/header files are required? Is it possible?! Most grateful for any help you could give me (I've just been set an assignment in C++, and it would be real useful to have it at home!)

Thanks

Steve

Well, from all accounts I've heard. DVI still cannot do full screen
60 frames per second animation. Not only that, the harddrive and bus
speed to fetch full color frames from the HD, simulatenously decompress
and display can only be found on the Amiga, or the HIGH end PC's.($$$)
What would also hinder my decision is that choosing a PC(why is
Personal COmputer synonymous with IBM?) means I'll have to deal with MS-DOS
the worst disk ooperating system ever invented. No matter how much you
hate the Amiga, you'll have to agree that the 11 character file format
and MS-DOS file system is a large bottleneck. AmigaDOS is much like the Unix
your probably typing this message on.

If your smart, you'd wait till the Motion Picture Experts Group finalizes
the MPEG compression standard for motion video. JPEG has already
proved it's usefullness. Commodore is already supposed to license
the MPEG chip from C-cube when it's finalized for use, to be used in
both Amiga's and CDTV. (RUMOR)

The Video toaster blows away DVI's special effects with LIVE video
effects in real time, including Chroma Fx, character generation,
multiple input sources. There is also a device on the Amiga called the
Video Blender, which is nothing more then a 'SuperGenlock' that can
be programmed with DVI wipe/transition effects (over 400 DVI wipes

are supplied with the device, more can be made by the user with an editor)

Remember, the Toaster can be used on a A2000 @7mhz, whilst DVI probably
requires a SuperDuperMega 486/386.

Source record: 234090

It's been a while since I've seen a discussion about TT video modes. Anyone care to refresh my memory on what sort is available. Specifically I'd like to know how many colors can be on the screen at any one time. I've seen IBM VGA's with 256, and I feel that that is a minimum for displaying photo-graphics. H and V pixels per screen is actually a less important factor (IMHO) than color selection depth.

2123. How much should I pay for used color monitor?

Newsgroup: comp.sys.atari.st
Date: 1991-03-05 17:17:49 UTC

A friend of mine has an Atari ST color monitor that I am considering buying. My questions are:

1. How much is a fair price to pay him for a used color monitor (I don't want to jip him nor me)

2. What is the current mail order price for a new monitor?

Thanks,
Al

I can't speak for Europe, but I can find about 20 or 30 channels on my
local cable station that use Amigas. (How do I know? I've seen
GURU msgs, Amiga Workbench screens, etc when flipping through channels
when the cable channel was reseting. Also, I have an eye for Amiga
grafix and software.)

>Tele-5 in germany (approx. spred 52 milj.people) has used good old st for it,
>as well as for other applications (texting etc.) and they're now mowing to TT
>and said it's a hole new world !!!
>- and ONE OF THE REASONS FOR TT INVESTMENT BEING THE VIDEO-TOASTER
>-If you can get a copy of 2/89 of the 68000'er magazine, start reading from
>page 42 and find out that many things that A3000 does with Vid.Toast... are,
>and have been done with st and specially customised programs for years !

Frankly, what one markettroid/editroid said in a magazine doesn't
impress me. I've been reading misinformation in BYTE, Pc magazine, and
others for years. The A3000 wasn't out in 2/89, and neither was the
Toaster, so I find it even harder to believe. Finally, what can be done
in software, cannot match the Toaster fully. The Toaster is a hardware
device that comes with great software. The hardware allows you to buffer
and switch live video, while performing character generation/titling in
real time and digital video effects/chroma fx in real time. What can be
done with the st and speciallly customize programs is perhaps generate
character titles, perform some effects on still picture frames, but
I doubt software alone is going to match the Toaster.

The Toaster's price is extraordinary. The software alone that comes with it
(LightWave3d and Toasterpaint) would cost atleast $600, combine this with
the Hardware you get for only $1500.

The big reason the Lexicor article was unbelievable is this:
1) NewTek announced that the Toaster would never be ported to another platform, and they would remain dedicated to the Amiga market.
2) The Toaster software and Hardware relies on the ability of the Amiga's custom chips.
3) Some, if not all of the toaster's software is written in assembly making a port difficult.
4) The Toaster's software is integrated for a multitasking environment with interprocess communication and the Amiga's Arexx IPC language making #3 on this list more difficult.
5) The Lexicor article stated they compared an AMiga 3000 against a TT display, but from the sound of it, they actually used an Amiga 1000.
a) The Amiga display no longer 'jaggies' on the edge of it.
b) The Amiga display, while having the power of interlace for video work, also includes flicker free modes now. Ranging from 160x480(or 960 interlaced) all the way to 1280x200 noninterlaced(or x400 laced) with every mode inbetween (including 640x480, or 768x512 PAL)
c) Saying a TT did a raytrace in 1 hour while an Amiga3000 took 24 hours. I don't care if the TT was running at 90mhz '030 and the Amiga was using a ray-tracer in written in Basic, nothing justisfies such a speed gap unless 1) The TT had some special processor card helping
2) They were actually comparing it against a 7mhz 2000 like I suspect
3) The TT wasn't running a real raytracer, but a customized renderer.
4) for a point of comparision, the Toaster renders the standard Teapot, with a chroma rippled surface and image mapped onto it in 10-15 MINUTES. There are some reasons it can do this. It was written in assembly code(optimized for speed) and it DOESN'T raytrace. Instead, LightWave3d uses the scanline based approach (which normally doesn't do shadows or reflections) and cleverly adds in efficient shadowing and reflections. The differences in output quality from a real ray-tracer and LightWave's render is so small, I can't tell the difference.

I may have believed Lexicor's article, but it reaked of half-trues and total misinformation. It wasn't comparing to the AMiga, it was bashing it.

If they really were comparing it to the Amiga 3000 this makes it even sadder. Because then it would have to be either BLATANT lies, or the Lexicor guy who did the comparision was SO inept at his job that he didn't even know how to change the screen preferences. Any idiot can click on the Prefs icon and select a non-interlaced screen, or turn on the Display Enhancer. In fact, the default configuration setup of the 3000 is non-interlaced display enhanced. Futhermore, to make an A3000 raytrace that slow, you'd need to have the 16mhz version, with only a 68881, then you'd have to use up all the 32bit Fast ram, so the raytracer would be forced to load into the slow video (chip) memory.

So you see, with these mistruths/lies in the Lexicor article, no Amiga user in his right mind would believe the Toaster is being ported by NewTek, or some Atari company is making an interface that doesn;t require the purchase of an Amiga, since they'd have to rewrite all the Toaster software from scratch, or else reverse engineer-pirate it.

>But the fact is:"If you can shape it in your mind, you will find it in your TT"

"Make up your own mind! AMIGA"
"The computer for the creative mind."
"Multimedia since 1985."
"The coolest device of 1990 was the Video Toaster."

Or how about a machine that can transfer over 1.9 megabytes per second from
the disk while only using 1% of the CPU.

I don't now why the hell this is in comp.graphics, take it to comp.sys.amiga.
advocacy.

Bloom County characters in Dungeon Master? (I'll assume it's DM II - Chaos) Wow, Great!! I wish I'd thought of that! Right now my party consists of a werewolf in a biker jacket, Santa Clause, an evil wizard from the Elementals comic, and BlacJacMac from Grimjack comics.

You can save the pics alone with Chaos strikes back. Anybody else have interesting characters?

2126. Teac FD235 help needed

Newsgroup: comp.sys.atari.st
Date: 1991-03-05 18:52:24 UTC
From: cczmjj@vax.nott.ac.uk
Message-ID: <00945279.C14AC3C0@vax.nott.ac.uk>
Source record: 234085

Greetings, a friends Teac FD235 connected to his ST via his own cable
can read but not write to or format a disc. The drive is brand new.
Does the cable to the drive need terminating with a resistor pack?
When trying to format the disc the ST replies:
"disc unservisable or write protected"
Any help greatly appreciated.
Thanks,
Mal.

2127. Megs 2 system for sale

Newsgroup: comp.sys.atari.st
Date: 1991-03-05 19:01:18 UTC
From: aa519@cleveland.Freenet.Edu
Message-ID: <9103051901.AA04191@cwns1.INS.CWRU.Edu>
Source record: 234095

I have the following for sale. I would like to see it as a complete package,
but I will consider offers.

Atari Mega 2 ST w/ 2 megs ram, blitter, 720k drive, TOS 1.2 and 1.0
Atari SM124 Monochrome monitor
Future System GTS-100 disk drive w/LED track readout
Avatex 2400 modem
Star NX-10 printer w/ 3 ribbons
5 outlet power strip (under monitor style)
DEC hard drive/floppy drive case w/power supply.
Monitor Master (allows two monitors, as well as RCA outputs)
plus plenty of software (too much to list)

All of the above have all manuals except power strip, drive case, and
monitor master. Mega 2 also has warentee card. ALL is in MINT condition.
I also have various magazines, books etc I will throw in if you buy the
complete system. I really hate to part with it, considering I just got
it, but I have bills to pay (grin). I am asking $1500 for the complete
system. I will pay shipping in the 48 states, or if you are close enough,
I will install it for you. (I need a vacation!). Leave me a message.

ST, and graphics groups. Flame-war prevention starts at home.

2129. Atari TT/ Video Toaster clarification

Newsgroup: comp.sys.atari.st
Date: 1991-03-05 20:54:27 UTC

Message-ID: <17757@milton.u.washington.edu>
Source record: 234092
Cross-posted to: comp.sys.atari.st,comp.graphics.visualization

Man, has this subject wreaked some havoc..

Let me clarify a few points, since it is evident that AMiga
readers are pretty upset about the articles i posted.

Regarding the Video Toaster marriage to the ATari TT:

1). I have heard that a 3rd party is considering the marriage.
** I have never spoken with NewTek nor with ATARI..
... all i have heard is that a 3rd party is interested and
perhaps working on the marriage to be furbished this year.

SO please understand that I have never made mention that ATARI is
involved with the Toaster. Atari may indeed be, but i have
absolutely NO knowledge of this.

2). ANy third party may in fact take an existing Video Toaster
off the shelf and try to make it work on a TT. This is what
I understand to be happening.

You can author laserdiscs just fine with the Amiga. Amiga World did an article on how to do it, including a list of companies that press discs and their pricing structures. Hell, you don't even need a computer, just a good editing suite.

CBM is courting a company that does real-time compression to-from CDs. 'nuff said.

I have available a couple of sets of original shrink-wrapped Mac System 6.0.3 disks (the four-disk set, including two utility disks, the System disk, and a Printer disk) without documentation, for $18 including shipping. These disks are reasonably current with regard to emulation (there aren't any major benefits to using the newer 6.0.4 or 5 to my knowledge), and at any rate will allow you to be officially upgraded by a Mac dealer.

Please email to bills@microware.com for arrangements.

Yes you:
I've been an Atari ST owner since around '86, but have just recently stumbled onto this little niche in the net woods. Not much Atari action out here in the 'burgh, so it's good to hear from other users! I post this for the following reason. I am interested in getting any information any of you may have available on any interesting hardware/software, especially in the area of graphics enhancement. I tried to read all the past post, back from about the middle of January, but I got about as far as the Amiga/Atari flame war, and just couldn't deal anymore (I've used both, and don't care). I would really like to upgrade to better graphics, though, and the STE/TT really does not cut it. I'll believe Lexicor when I have their product in my hands, and not until. How about the Automatic overscan box? How about increased resolution? Colours? I guess I should mention that I have the STacy4, and a RF mod for colour, Spectre GCR, SuperCharger, Neodesk, etc.. I am also interested in programming reference material, a decent word processor (I have both WordFlair II and WordUp, which is lousy) DTP, DTVid, and anything else you are just dieing to tell me about. I want to know what else is out there, and why I shouldn't just jump ship and go to another platform. I have been faithful for a long 5 years now, and my patience is wearing thin. Sure, we have one of the best hardware buys, but where the hell is the software base? Help!

What the Atari TT should be (IMHO):
Just thought I'd add my late $.02.

1) Minimum 2 Meg, expandable to full 32 bit address path.
2) at LEAST 3 expansion slot, preferable a standard (VME!:-))
3) decent graphics resolution (min 1024x768x4096)
4) SCSI ((2!) not 2 ports, but the new standard)
5) ethernet
6) DSP
7) Power on, volume control, screen control from keyboard
8) composite RF out
9) true multitasking, not an add on
10) 32 bit support in the OS (so we can have some sorta standard, ala quickdraw)
11) overscan (essential, and a "no cost" addition)
12) support for NTSC video in the OS
13) Better support for audio in the OS
14) interprocess command language ala reXX/Mach
15) if you'r gonna do a "cartridge" port, at least address more than 128k
16) a much better GUI (NeXTStep!)
17) ability for multiple workscreens
18) Upgradable Processor Design, and built in file compression

19) Real support from a real company (Yes, apratt is doing a much better job, but...)
20) and put it all in a nice case, not that horror of a shell the TT is in.

I know that this is very close to a NeXT, but don't you all think that Atari could make something like the above as well? As other posters cried, Dave Small, where are you? I also know that this would be expensive, and would stretch Atari's Power without the Price stance, but, what power, at what price? Why can I not get more power if I want it? Why is the Atari designed to lock you into one path? The TT was a move in the right direction, but not really all that close. What kind of joke is trying to foist VGA on us, and calling it enhanced, when a SuperVGA card can be had for under $200 dollars, with twice the TT resolution)? It is old, obsolete, and will not cut it for a Unix workstation (if Atari ever gets their Unix out (March 13?)). One expansion slot is not enough, especially since it will go directly to the display card that will have to replace the standard video toad. Give TOS emulation in a window, and give us Mach. Not all this need to be hardware implemented, as it would be ridiculous to expect people to pay for what they don't need, but the room and the possibility should be reserved, in both the OS and the harware.
At whom is the TT aimed? Schools, ha, they'll buy Mac IILC's at the bargain basement prices for which apple will sell them to schools, to get the name out. Unix workstation buyers? They'll get a SPARC, or a NeXT, which are not very much more, and are *much* faster. Businesses? You think you'll get them away from tried and true software standards in the PC, or at least a wide software base in the Mac? Not at the TT's price point. The TT is a GREAT machine, with good software, and really great potential, for $1,000 less! If NeXT can market a very similar machine, for $4995, Why can't Atari, an established complany, make some of these things into option, and cut this by half?
And the MEGA STe should be right behind!

Dave Small, where is HyperWeb?!!!

Go ahead and say I am unrealistic, say I should be happy with what I can do, tell me to go over to comp.sys.amiga, but Do SOMETHING.

One last thing. There have been several articles in reputable computer mags (well, I guess since ...Shopper dropped Atari and Amiga coverage, they are not really all that reputable!) about a company that has come out with a chip that will allow standard VGA monitors to display 765,000 colour onscreen, in standard VGA modes up to 1024x768. It will supposedly market for less that $100. I want this in the STe! Allan Pratt, David Small, SAM TRAMIEL, can you hear me?

Hi,
Now that I finally own a hard drive, I have had a couple of problems come up. The first is that I forget where it was that I put files, if I haven't used them for a while. Does anyone know of a file finder, preferably in the form of a DA? The second problem has to do with DAs, in that I find myself with too many of them, and I end up with not enough of my 1040's 1 meg to run certain things. Now, I know I could take the sensible approach and simply reboot without all the DAs, but where's the fun in that? Therefore, I am seeking ways of increasing how much memory I have (well, actually how much the computer has, but be that as it may). I might get an upgrade for my ST, but I am also thinking about getting a STe instead, since simms are so much easier to use. I know some software will not run on the STe, but I was wondering if anyone could give me more info on this, since I would hate to get the extra memory and then find that a lot of PD software, games, don't run on it (I am assuming that those are the kind of things that might have trouble?) Also, has anyone tried hooking up PC-ditto2 (the hardware version) to an STe? Or does the software version wor
Any help/info would be greatly appreciated.

2140. A couple of questions (hopefully for the first time)

Newsgroup: comp.sys.atari.st
Date: 1991-03-06 08:20:11 UTC
From: cierdain@ucrmath.ucr.edu
Message-ID: <12519@ucrmath.ucr.edu>
Source record: 234073

My apologies if this gets posted twice. I accidentaly posted it from my own account first, but I've never seen anything actually reach the net from that machine, so here I go again...

Now that I finally own a hard drive, I have had a couple of problems come up. The first is that I forget where it was that I put files, if I haven't used them for a while. Does anyone know of a file finder, preferably in the form of a DA? The second problem has to do with DAs, in that I find myself with too many of them, and I end up with not enough of my 1040's 1 meg to run certain things. Now, I know I could take the sensible approach and simply reboot without all the DAs, but where's the fun in that? Therefore, I am seeking ways of increasing how much memory I have (well, actually how much the computer has, but be that as it may). I might get an upgrade for my ST, but I am also thinking about getting a STe instead, since simms are so much easier to use. I know some software will not run on the STe, but I was wondering if anyone could give me more info on this, since I would hate to get the extra memory and then find that a lot of PD software, games, don't run on it (I am assuming that those are the kind of things that might have trouble?) Also, has anyone tried hooking up PC-ditto2 (the hardware version) to an STe? Or does the software version work?

Any help/info would be greatly appreciated.

Andrew (elvis@watnxt2.ucr.edu (my account) or
cierdain@ucrmath.ucr.edu (my friends account which actually works))

2142. UIS III, Uniterm, DCDesktop

Newsgroup: comp.sys.atari.st
Date: 1991-03-06 20:43:16 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Mar6.154317.39613@camb.com>
Source record: 233970

I've encountered the following problem and was wondering whether or not anyone
knows how to correct it, or if it can be corrected.
Message-ID: <1991Mar6.161126.16586@rodan.acs.syr.edu>
Date: 6 Mar 91 16:11:26 GMT
Organization: Syracuse University, Syracuse, NY
Lines: 11

When running DCDesktop and using Uniterm to connect to a mainframe, I tried
to exit Uniterm and do something at the desktop. When I got to the desktop
I tried to access UISIII via the UIS da...when I did this the machine
froze and I had to reboot, losing my communications connection. Is
this something that should happen, i.e. is it impossible to retain my
communication connection while doing something at the desktop?, or
is there some way to accomplish this kind of activity?
Thanks.

I use UIS III all the time within Uniterm, so maybe DCDesktop is giving you grief (I don't use DCDesktop).

I have had to reboot for other reasons during an online session before, however, and it would be a pain if I lost the connection. I have the "force DTR" switch set on my modem, so it thinks my terminal is on and ready whether it is or not. This way I can go to the desktop, reboot, whatever without worry. There are communications programs that "drop DTR" to break the connection for you. Setting this switch will override this feature of these programs, leaving you to tell your modem to hang up on your own.

2144. booting from hard disk

Newsgroup: comp.sys.atari.st
Date: 1991-03-06 20:58:49 UTC
From: thaanuj@prism.CS.ORST.EDU
Message-ID: <1991Mar06.205849.23089@lynx.CS.ORST.EDU>
Source record: 234100

I just got my syquest w/advantage+ system hooked up and running well. I have one small problem, though. It **never** boots correctly the first time. After a long wait, I get on of the following:

floppy turned on: desktop with just a: and b: icons
floppy turned off: blank desktop with just a menu bar

When I hit reset, it boots from c: just fine and desktop appears exactly the way I want it.

This isn't a horrible problem, but for all the dough I just shelled out, I want it to boot on the first try on powerup.

Other info: Old 520ST w/TOS 1.4. (Almost) empty auto folder on c: (all I have is UIS III since memory is a little tight right now).

If this is normal and expected, or wierd and a sign of trouble, please let me know.

Thanks in advance,
John Thaanum thaanuj@prism.cs.orst.edu

I have an older ST (purchased in 1986) with an easieST memory expansion board installed with 2mb of memory. Recently it has begun to lock up with narrow vertical lines on the screen and eleven bombs. This happens when the machine has been on for at least 1 1/2 hrs. If I am able to reboot I have only 1/2 mb of memory available. I had the connections to the expansion board soldered, and that has improved the problem -- it happens less often and the machine can be on longer -- but it still happens. Any ideas?? Suggestions?? Did this ever happen to anybody else out there? Thanks in advance -- a lot!!

2148. Re: What's the BEST CLI for the ST

Newsgroup: comp.sys.atari.st
Date: 1991-03-12 14:46:53 UTC
From: david@doe.utoronto.ca
Message-ID: <1991Mar12.144653.11654@doe.utoronto.ca>
Source record: 233956

Bash and ksh are Unix shells, so they have a user and support base many
times larger than the ST could ever afford, and both of them run well
under MiNT. Shells like gulam are not too nice, because they have all
of the commands built-in. That's acceptable if you're running only one
invocation of a shell, but if you have three shells open in three MGR
windows, and a fourth running a script in the background, it's a ridiculous
waste of valuable memory. Besides, it's nice to be able to run
commands like rm(1) and cp(1) in the background instead of waiting
for them to finish.

I would not suggest using any shell which does not use MiNT, since it
will not have multi-tasking (please, no more flames from people who
can't tell multi-tasking, running many tasks, from multi-processing,
using more than one processor) or true pipes (using temporary files
just doesn't cut it).

>The other way is the one that the Germans came out with is to Change the
>Clock to the WD 1770 controller IC, but this can be hit or miss as the
>IC is not ment to run with a 16 Meg HZ clock,

The WD1772 controller has to be the more recent type for it to work properly.
All recent ST's should have the right chip. The suffix on the older chip is -01
and on the newer one is -02. I think the date-stamps are 1985 and 1987. The
simplest way is to let the density sense line select the clock speed. The clock
to the controller should be deglitched during the speed change. If you want to
format DD disks to HD (doubtful practice) then a little more circuitry is
required, probably involving the sound chip.
It would be nice to change the step rate for the drives to suit the disk each
time a disk is changed.
I don't have it up and running yet, so I can't post the details. If no-one beats
me to it I'll get it done sometime.

Meanwhiles, could someone point out which pins carry these signals:

a) disk-in-drive
b) density-sense
c) .....anything else not on older DD drives?

oh, and while I'm at it:

Does anyone know whether the WD1772 can handle 1024-byte sectors?
If so then it should be possible to format 1848k onto a HD disk.

We're working on the next official release of Sozobon C and hope
to release it in the near future. We really appreciate all the work
that people like Leigh have put into the compiler. We don't have
access to all the hardware/software combinations that people are
using, so fixes like these are a tremendous help.

We'd like to incorporate all the fixes and improvements that people
have made, as well as some of our own (long identifiers, for one).
If you've made bug fixes or added features, please send them to me
via email or disk. We've had trouble reaching some of the archive
servers, so please send us your fixes even if they are available
on a server somewhere.

If you send your changes by disk, send it to:

Tony Andrews
4704 Berkshire Ct.
Boulder, CO 80301
USA

I can't promise a response to each message, but we'll do our best to
incorporate your changes in the release. Thanks again for your work!

Europe. Try some of the German-written text editors and word processors. I use Tempus 2; not a word processor, but it has word-wrap (which is all I need for TeX) and scrolls smoothly at 40 lines per second. I gather that the authors have written a fully-featured word processor which is similarly speedy.

From: os9paul@gkcl.ists.ca
Message-ID: <20101@ists.ists.ca>
Source record: 233964
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I recently purchased a 'previously owned' SM124 monochrome monitor. It seems to work quite nicely except for one minor problem. When the display is a black background and there is very little text on the screen, the image is quite dim. As more characters are displayed the image brightens as if the brightness control were being turned up.

Any comments or suggestions about possible components to check/replace? The monitor is from Korea and is dated December 1987.

2162. problems with pd game 'Goldrunner'

Newsgroup: comp.sys.atari.st
Date: 1991-03-13 04:40:06 UTC
From: thaanuj@prism.CS.ORST.EDU
Message-ID: <1991Mar13.044006.11292@lynx.CS.ORST.EDU>
Source record: 233966

The syquest drive I purchased recently had about 25meg of pd stuff on it, which I am just now sorting through to see what is worthwhile. One of the programs was a pd game called Goldrunner. I unarc-ed it and tried playing in monochrome. Here is where an interesting sequence of events occurs:
1. Many bombs appear. I figure it must only run in color.
2. I hit reset, thinking I'll play it later. Computer fails to boot. Solid black screen.
3. I turn off the machine, wait a few seconds, and turn it back on. Nothing.
4. I try booting in color. No problem.
5. I try to play Goldrunner again. Bombs-o-plenty during loading.
6. I hit reset. Same screen with program title at top of screen and busybee -immediately- appears without any disk accesses. Computer is locked up.
7. I power down, wait, and power back up. Same screen as #5 and #6 above, slightly corrupted by an occasional stray pixel.
8. Repeat #7. Same results.
9. Since the cover is currently off my computer (I have been fiddling with ram upgrades) I decide to unplug it, and ground every pin on each of the ram chips.
10. I reboot in mono. All appears well. I load Flash! and call my campus network server and hookup to the machine I am typing this on.
11. In the middle of the first article in c.s.a.8bit, I set a new personal record: 13 bombs! I have never seen anything like it!. Computer is now hopelessly locked up.
12. Repeat #11. I login and start typing this article. So far so good...

Now I don't know if Goldrunner is the problem, but I deleted it and will never know for sure now. I have owned my ST for about a year, and the person I bought it from got it originally in 1986. For all these years it has been about as reliable as an anvil, so I don't think it was my computer's problem. My advice to you is to avoid 'Goldrunner' unless one of your hobbies is computer-masochism.

Actually, not they didn't; at least not entirely. They licensed a few
concepts, but their recent suits go way out of these bounds. That is why
Xerox has mentioned publicly that it intends to pursue legal action
against Apple Corp. I can't quite remember the specifics of the license,
or when the Apple/Xerox trial will be, but I think that I first heard
about it on computer chronicles, last year. BTW, I wonder what they will
try to do against Steve-O over at NeXT!

While on the subject of mice, drunk or otherwise, has anyone noticed that when you try to move the mouse pointer to quickly in GEM, the mouse starts to accelerate in the intended direction, then does an aboutface, and heads in the other direction, and keeps doing this until you slow down. This is quite annoying. I keep forgetting to check it in Mac mode to see if it is GEM or the hardware controller. Probably lame GEM. I have seen this on both my MEGA 4, and my STacy, as well as my dad's MEGA 2. Hmm....

Does anyone out there have this shell? I really like Gulam but it just
hates to work with MiNT. The problem with the other shels is that all
of the commands are external programs. This Okami Shell sounds great
if anyone has it, I (and probably other people) would appreaciate it
if it was available on the net. Thanks

The way I heard it was that half the board of directors of Apple were also on
the DRI board. So to avoid shooting themselves in the foot they just settled
it all out of court. It's odd though that the new TT desktop is getting *VERY*
Mac like in most respects, even XCONTROL works like the Macs accessories.
The most notable exception is the drop down menus.

If you change the modem's DTR line setting, you should be able to retain a
connection while in the desktop, and even if you shut the computer itself
off.

>any hard-disk accesses, then you're in business. If not, use CACHEnnn
>(where nnn is three decimal digits, 080 is a good place to start).
>

Hi,

I'm running TOS 1.6 and when in GEM it appears that the disk is cached automatically to some extent. For example, if I double click on drive A, shut the window and then double click again, the disk is not reaccessed. This is great, but doesn't seem to work with NeoDesk 3 - which I use all the time. I assumed this was NeoDesk doing something strange, so proceded to get disk cache programs and try using them. They certainly stopped the disk being reaccessed, but if I changed the disk, it didn't clear it's cache. Consequently, on the next disk write, it wrote the directory entries from the first disk onto the second - basically wrecking the whole disk :-(
Is this a problem with NeoDesk, or am I doing something wrong? The cache programs I've tried are: acache, cache, dcache, chcache. If anyone can help, I would be most grateful - I HATE the disk reaccessing every time I come up a directory!

Thanks

Steve - csuab@uk.ac.warwick.cu

>It would be nice to change the step rate for the drives to suit the disk each
>time a disk is changed.

This cannot be done in a way, that will work on all versions of TOS,
cause the location of the drive parameter block in RAM varies with the
TOS version.
If You want to use documented system calls only, You ll have to change
the step rate once and for all.

>a) disk-in-drive
>b) density-sense
>c) .....anything else not on older DD drives?

depends on drive. There is no standard.
Teac FD235HF carry the "DD-disk-in-drive" (active low) on pin 2 if the
appropriate jumper on the drive is set.
You must also set the HD jumper for the drive to detect HD floppies and
reduce write current whe DD disks are inserted.

>oh, and while I'm at it:

>Does anyone know whether the WD1772 can handle 1024-byte sectors?
>If so then it should be possible to format 1848k onto a HD disk.

This can be done in software. The WD1772 will read and write 256, 512
and 1024 byte sectors. TOS will only work with 512 byte sectors.

It is possible and pretty safe to format 10 sectors per track with DD
floppies, and so is 20 sectors per track with HD drives and media.

Eric Smith plans to add shared text segments to a later version of MiNT.
I am not sure exactly what this involves, but I imagine that he will come
up with some way of identifying a program which is already running
(same path and checksum?), and swap the .bss and .data in and out with
task changes. This would slow down MiNT a bit, but with programs like
bash(1) which is mostly .text, it would save a lot of memory. Comments?
Suggestions? If someone wants to write this themselves, it will show
up faster (Eric shouldn't have to do everything himself).

adamd@rhi.hi.is (Adam David) writes:

>In <1991Mar07.080136.28020@ecst.csuchico.edu> ekrimen@ecst.csuchico.edu (Ed Krimen) writes:

>>I came across a utility recently that mentioned in its docs that to
>>speed up the floppy drives, you can set them to 2ms and no verify.
>>How reliable is this? Does anyone out there have any experience with
>>this?

The step rate depends only on the stepper motor of the drive.
Most 5.25 inch/80 track drives will work fine at 2 ms step rate.

most 3.5 inch drives will only work down to 3 ms.

There are two kinds of "verify": the step verify and data verify.
I suggest, never to switch of the re-read after write (date verify),
cause disk drives and media are never perfect. This data verify is
something done in software only.

The step verify - a controller option: after a step the controller chip
reads in the header of the first sector it can find and compares the
track number in the sector header with the contents of the track
register; if they are equal, the step succeded; if they are different,
the controller says "seek error" to the MPU - can be switched off
safely.
It does not give more reliability if You do not step too fast for the
drive mechanic. If You have a slow stepping drive - perhaps rated at 3.5
or 4 ms per step - the step verify will relax the step timing a bit and
will therefore help to reduce the "drive X is not responding..." alerts.

Hi! (Zaphod Beeblebrox)

2176. Mega Ste and Clab's notator?

Newsgroup: comp.sys.atari.st
Date: 1991-03-13 12:58:06 UTC
From: johnj@hijg.prl.philips.nl
Message-ID: <2587@prles2.prl.philips.nl>
Source record: 233983

Hi netfellows,

After trying to find out how to upgrade my ST520+ (=1MB) to 2.5MB,
I think I found someone who is willing to buy the machine from me
for a good price (well anyway the price is good enough for me).

So now other possibilities are there for me: Buying a Mega Ste!

As I still want to use my software on the machine
I do have some questions:

1. Does C-lab's NOTATOR run on the Mega Ste.
Possible forseeing problems will do as well (if there are any).

2. Can I still connect C-labs's SMPTY/EBU synchronising box
(called UNITOR) to the Mega Ste?
And what's more, does it stil works, as (imo) Unitor uses the
rom-port on a rather dirty way?

3. Something completely different from music:
As I bought the RAM upgrade (1M chips), can I just buy a
2MB Mega Ste version and plug in the 1M chips (from the
left over Xtra Ram upgrade kit) to make a 4MB Mega Ste?

Thanks in advance.

I intend to sell my Atari Transputer Workstation ATW 800 Issue 4
because now I'm able to use more than enough Transputers to work with in
a parsytec MultiCluster at University of Kaiserslautern.

The ATW includes:
Software:
HELIOS
X Windows 11
bison, ...

Hardware:
T800 20Mhz (not 17.5 MHz) / 10 MIPS
built-in slots for up to 17 Transputers, expandable
4 MB Main Memory
1 MB Dual Ported Video RAM (fast !)
Atari Mega ST incl. 1 MB RAM (all ST peripherals usable) as Server (TOS 1.4)
44 MB SCSI Harddisk
3.5" Floppy
16.7 million colors, > 1 million pixels (up to 1280x960 by now)
Configurable vertical screen frequency (!), e.g. 69 Hz on my EIZO 9070S
Blossom Blitter
Mouse
...

manufactured in Braunschweig, West Germany
no failures

Price:
DM 9500,- (1 US$ = approx. DM 1.50) + MwSt (VAT)
(I'm authorized to declare 14% German Umsatzsteuer tax (VAT)).

Source record: 233981
Cross-posted to: comp.sys.atari.st,comp.music

Hi midi & atari-st fans,

I am writing a midi program for the atari ST. As many other programs,
I would like to use the standard Midi file format to store
midi data on disk. However, I don't know what the terms on this
format are. Where can I find information about the midi file format?

The information i would like to get is:

1) Are the parameters in the standard midi file machine independant.
Can all parameters be used on every midi instrument?

2) How are the parameters orded in the midi file.

3) Can machine dependant data (for example midi exclusive data) also be
stored in the midi file, or must i use my own format to store these
data.

4) Many midi music programs are using the standard control commands
for manipulating the music (such as bender, hold etc.)
I have not seen a program use control commands that are
particularly for a midi instrument (such as sound effectors which
are not descriped in the midi standard).
Programs must use the standard control commands and the
'user defined' control commands for manipulating music
(i think) to get the most flexibility.
Is there a program on the market that uses this concept?

Is there a good book written about this subject?
Reactions to comp.sys.atari.st (i think some musicians and midi
programmers would appreciate the answers too) or by mail.

>
>FATSPEED and FOLDRxxx aren't necessary.

FOLDRxxx may still be needed. Even with TOS 1.4 there is a static allocation of storage which puts an upper limit on the number of active folders you can have. If you exceed this limit, you get a message to that effect, the computer stops, and you must reboot. Because of better use of the storage pool in TOS 1.4, you might be able to get by just fine without increasing it. Also, many hard disk drivers increase it for you. But if you do run out, you can use FOLDRxxx to icrease it further.

The Xerox action against Apple came before a judge sometime last year (or
1989, not sure), and it was thrown out of court. I think the judge said
something about Xerox having waited too long to bring the action.

An interesting sidenote is that Xerox filed the court action shortly after
William Lowe took over their PC division. William Lowe ran IBM's PC
division when the original PC was developed and introduced.
Coincidence?

It's called the "doctrine of laches:" If somebody else is using your property, and you know it, and you do nothing to protect it, after a certain period of time (5 years, think, but perhaps depending on the property and jurisdiction), you no longer have the right to protect it.

/ col:comp.sys.atari.st / ggreenbe@rodan.acs.syr.edu (Gerald Greenberg) / 1:43 pm Mar 6, 1991 /

I've encountered the following problem and was wondering whether or not anyone knows how to correct it, or if it can be corrected.
Message-ID: <1991Mar6.161126.16586@rodan.acs.syr.edu>
Date: 6 Mar 91 16:11:26 GMT
Organization: Syracuse University, Syracuse, NY
Lines: 11

When running DCDesktop and using Uniterm to connect to a mainframe, I tried to exit Uniterm and do something at the desktop. When I got to the desktop I tried to access UISIII via the UIS da...when I did this the machine froze and I had to reboot, losing my communications connection. Is this something that should happen, i.e. is it impossible to retain my communication connection while doing something at the desktop?, or is there some way to accomplish this kind of activity?
Thanks.

2188. Mac system 7.0 and GCR

Newsgroup: comp.sys.atari.st
Date: 1991-03-13 18:57:35 UTC
From: mc4c+@andrew.cmu.edu
Message-ID: <QbrbMTa00VAyI5H14P@andrew.cmu.edu>
Source record: 233994

O.K. folks there is some bad news and some good news, and a disclaimer.

1) 7.0 does not work yet with GCR (disclaimer: I only have 2.65, so I do not know if 3.0 will help, but I doubt it.) It does the install O.K., but then it can't boot up into 7.

2) However, after displaying the dialog: Welcome to Macintosh
You're gonna love it!
it then puts up a system bomb box saying: unimplemented trap.
Now, that does not seem all that bad, because it implies that if that is all that is wrong, it will be a quick hack to get it working. But who knows what lurks behind the mask.

3)Disclaimer: In addition to the above, it was only a developers Beta release of 7, so maybe that affected things, but I really doubt it.

DAVE, HELP!!!

2192. Canon BJ-10e bubble jet printer

Newsgroup: comp.sys.atari.st
Date: 1991-03-13 22:05:43 UTC
From: petcher@wuphys.wustl.edu
Message-ID: <1991Mar13.220543.14141@wuphys.wustl.edu>
Source record: 233997

Does anyone use the Canon BJ-10e printer with the ST? If so, what do you think about it? How is it for speed? And in particular for graphics, as if I get it, it may also serve as a printer for small TeX documents.

On a related note, does anyone know where I can get a dvi driver (for printing TeX output) for this printer to run on the ST? It emulates the Canon BJ-130e and the IBM Proprinter X24E (whatever those are).

Thanks,
Don Petcher

I was referring to the new GEOS _for_PC-Clones_ - designed as a "poor-man's" Windows 3 - in other words, it will run (quite well, I read) on a 512K 8088. The reviews I've read have been quite good, but it is still simply a GUI, relying on MS-DOS for the OS (and PC BIOS, to be precise).

There is _no_ connection between Geoworks and OS-9 or OS-9000; not sure where this rumor may have started, but there is definitely no link. OS-9 is our 68xxx-specific operating system, OS-9000 is more portable and currently runs on both 680x0 and 80386/486 systems. There has never been (from Microware, anyway) any OS-90...

>It's nice that the Atari ST is able to run other operating systems, but it

>portable and inexpensive. Geos shows that a good assembly language program
>makes the most of a processor. OS/9 demonstrated this on a Tandy CoCo 3 too.
>OS/68K is available for the ST, but it is a little expensive for most people.

For single copies OS-9/ST is $600; compared to the price of some of the low-end Atari hardware this isn't especially cheap, though considering that it includes a C Compiler and many other utilities and that we sell essentially similar software for some industrial CPU's for ~$2000, it's not especially expensive, either. The net cost can be _substantially_ reduced if someone (Atari, or Dave Small, for example) were to license OS-9 from us. For example, IMS is selling the MM/1, a 15 MHz 68070-based system (quite capable, including HD floppy, 1 Meg, decent graphics and sound, and many other goodies) _including_ Professional OS-9, for less than $900.

2197. HELP!!! PLEASE!!!

Newsgroup: comp.sys.atari.st
Date: 1991-03-13 23:23:38 UTC
From: thompson@tortoise.cis.ohio-state.edu
Message-ID: <95276@tut.cis.ohio-state.edu>
Source record: 234000

When I play games on my ST I use my T.V. because of the much larger screen. Some of the games I bought are from england and they run at a different frequency, causing the screen to flip. The problem is that my T.V. doesn't have a manual vertical hold, and since the T.V. doesn't adjust enough by itself it will always flip. So my question is, is there a hardware hookup that will adjust the frequency or maybe a "good" virus that would disable the programs ability to change the frequency available. Also, an explanation of why the programs change the frequency in the first place would be appreciated.

2198. UPDATE: THE GLOBAL BBS LIST.

Newsgroup: comp.sys.atari.st
Date: 1991-03-14 00:07:32 UTC
From: Marc_North@mindlink.UUCP
Message-ID: <5149@mindlink.UUCP>
Source record: 233948

UPDATE: THE GLOBAL BBS LIST

This update is provided to all those who have read the previous posting
of mine, of about 10 days ago. The following changes have been made:
[1] This project has been re-named. It shall, from now on be called and
referred to as, "THE GLOBAL BBS REGISTRY"
[2] The list is now accepting information regarding the existence of
all BBS's presently operating AND, systems NO LONGER IN OPERATION, from any
sources around the world. Hence the change in name. It is taken on faith that
no one shall deliberately attempt to submit information that is categorically
false.
[3] The purpose behind accepting and recording BBS's that no longer
operate is to acknowledge that the list exists as a true archive. Hence the
name change in regards to the word REGISTRY.
[4] The base purpose of the registry are as follows:
a) To record BBS names and phone numbers.
b) To record any information that is pertinent to the operation
of the BBS.(Subject to editing if information is too verbose or deemed
irrelevant)
c) To permanently archive ALL entries to The Global BBS
Registry.
d) To delete NO information.
e) To make constant updates. Indicating known system closures
with an appropriate mark.
f) To make updates to the list publicly available via anonymous
FTP.
g) To submit yearly updates of The Global BBS Registry to the
federal archives of at least, but not limited to, Canada and the United States.
h) To provide any country's federal archives, or educational
institutions either printed or magnetic disk copies of The Global BBS Registry.
Any requests for archiving of The Global BBS Registry must be submitted, in
writing, to me at the address at the bottom of this article. If the information
is to be subsequently made in any way publicly available, then a summary of
methods of distribution must be accompanied with the request and must support
the objective stated in paragraph (i) of this article.
i) No commercial or industrial institutions will be granted
direct authorization to obtain or maintain printed or magnetic disk copies of
The Global BBS Registry. Specific legalities will be available upon the initial
release of this information.
j) This will be an on-going project, without any known
termination date.
k) The spirit of this project is as follows: To document,
record, and preserve the sources of the unique culture that has arisen as a
result of the personal telecommunications community.

Official-ese out of the way, let me say that I am THRILLED with the responses to date! I have approximately 12,000 entries to The Global BBS Registry. I receive, on average, 1,000 new entries per day. I expect to have nearly 100,000 - 125,000 entries by the summer. I have BBS names and numbers from Finland to Spain, South America to Russia. LOTS from virtually everywhere in Canada and The United States, of course. But, as you are wondering, I need more.
I need to have both the numbers you call, and the numbers you NEVER call. I need your list from last night, and your list from 2 years ago. In short, you CANNOT overwhelm me with responses.
The information you submit, if it is to be of use in this project, must contain AT LEAST the following information: 1) The BBS's name, 2) The telephone number(s), and 3) The AREA and/or COUNTRY CODE(S). Any other information you supply is at your discretion. The more detailed the information, the more accurate the picture of the BBS. When possible, supply the Sysop's name, and the operating system or computer type that BBS runs on.
PLEASE!! This project will only be successful if I can count on your constant support. As the title indicates, this is a registry. If you or your friends are starting a BBS, please register it with me. Your name (as sysop) and your board's name and phone number will be preserved for all time in both this computer's archive as well as federal archives of Canada and The United States.
Expect to find a similar posting in other news groups. I apologize if the topic of this posting has nothing to do with the topic of the newsgroup it is being posted in.
Expect periodic updates as to the Registry's status and total count.

This is a serious project that I am undertaking. I will make no money from it, nor will my time be directly compensated for. All the hours of work I have already given, and have yet to give, are a labour of love. More so, I feel a responsibility to preserve this data. This information is not vital. Not now, not yet. But someday I believe it will be priceless. Not so much for the references to what will be ancient telephone numbers, but as a measure of the people who lived in what is now 'our time'. I ask that you please help me. Help me to preserve our era, our methods, our systems of communicating.

Many, MANY thanks to EVERYONE who has already sent me information, to everyone who WILL, and to you for taking the time to read this.

Sincerely,

Marc North

Source record: 233906

John Thaanun related problems with his ST after trying to run "Goldrunner"..

First of all, if it's the same game, "Goldrunner" was a commercial product
from MicroDeal in England, distributed in the USA by MichTron.. not PD..

>9. Since the cover is currently off my computer (I have been fiddling with
^^^^^^^^^^^^^^^^^^^^^^^^^
> ram upgrades) I decide to unplug it, and ground every pin on each of the
^^^^^^^^^^^^
> ram chips.

I highly suspect this is the cause of the problem, not trying to run a
game... except for highly isolated cases, software CANNOT damage hardware.

The symptoms described sound very much like the effects of fiddling with
RAM upgrades...

>
> ----------

I have had a few problems with Supercharger, including the ctrl-s freeze up problem. There seems to be some problems with the new version of the software. I have also experienced problems with using the Supercharger as a 1meg ramdisk for the ST. I discovered this when compressing/uncompressing files not long after I got my Supercharger(SC). I un-lharced a file that consisted of Degas pictures and I could only view some of them, others were garbled badly, and the rest couldn't be viewed at all. So I thought what the heck, must have a bad lharc-file here. So, I used the test option and this seemed to be true. But then I took the same exact file and put it in a ST-internal-memory ramdisk and checked it and it was fine. So I (and others) have come to the assumption that either I have a flakey memory chip in the SC, or that the ramdisk program is defective. Opinion is leaning toward the latter.
I called Rio Computers, where I got the SC and told them the problem. I asked if they could send me the previous version of the software and they gladly did this for free. I've heard that some things run w/the older version and not with the new (due to the lock-up bug). Now I have both but haven't tried the older version yet. I also have an IBM diagnostics program that I think will check the memory in the SC. Very soon I will try to duplicate the errors reliably and try out the old software. I will post my findings.

Anyone else having this kind of experience or already figured out the problem? I guess that the creators are working on the newest version to be out soon.

>and there being some sort of sequencer/sound editor program on the way for i
>but quite frankly I find it difficult to believe that they could include as
>complex (and presumably expensive) piece of hardware in a game costing just
>#34.95 ...

Unfortunately I don't have that specific game, so I can't say anything directly about it, but from the description it sounds a lot like the enhanced sound "device" that FTL plans to include with the IBM version of Dungeon Master.. essentially it's a D to A (digital to analog) converter that plugs into an IBM's printer port. The device is extremely simple, consisting mainly of a set of resistors and the connector. An audio amplifier plugs into the additive output of the resistor ladder to play the digitized sound.

If this is the sort of thing the French game is including, it would essentially give us a one-channel version of the STe digitized sound.

Well, to answer your last question first, games frequently resync the monitor
to have more clock cycles available for other stuff. If you run some games
(or demos, which also often do this) at 60Hz (USA standard), they slow down
tremendously. Now, to my understanding, european monitors default to 50Hz.
Thus, you need what is called a 50Hz Booter. It is a small program that
runs, then tells you to insert the disk to be booted and press a key. The
Booter then reboots, but leaves the monitor syncing at 50Hz. If there is
not such a booter on atari.archive, I can post one there. I can also email
you a copy, if you like.

I do not know if this will work on your televison, I have never tried it. I
would imagine that it will though.

2205. Two New Computer Announcements - CeBIT

Newsgroup: comp.sys.atari.st
Date: 1991-03-14 03:33:02 UTC
From: vanleejf@udcps3.cps.udayton.edu

CeBIT Computer Announcement
Repost from GEnie by Tom Harker of ICD.

CeBIT '91 Newsbreak

March 13, 1991

Things are really heating up here today in Hannover, Germany at the 1991 version of CeBIT which is the largest computer show in the world. Atari surprised everyone with their announcement and demonstration of two exciting new 68000 based computers. The following was described to me by Atari engineers as the were demoing the equipment. I have written this because I felt it newsworthy and an important boost to the moral of Atari users everywhere. I make no guaranty for the accuracy of this information but I have tried to get as much detail as possible. The computer names used are only "internal" Atari names and may be changed before release of the products.

ST Notebook

This is said to be the smallest 68000 based computer in the world. Its size rivals any PC Notebook style computer that I have seen. It is about 1/2 the size of my laptop computer and maybe 3/4 of an inch thick. Features include:

o A built in mouse device that consists of three buttons. The large center button is direction and possibly velocity sensitive to simulate mouse movement in direction and speed.

o A laptop size keyboard, possibly a little smaller than standard. The tactile feel was good.

o 512K ROM capability. It looked like TOS 2.05 was shown in the prototype. This prototype did have a very professional and finished look to it.

o 1 megabyte or 4 megabyte RAM versions available. Uses pseudo-static RAM.

o 2 1/2 inch form factor internal hard drive. 20 megabytes was installed. Presently up to 60 megabytes is possible. Probably an IDE (AT) interface.

o External ports include midi in and out, 1 serial, 1 parallel, 1 combo either floppy drive OR ACSI, 2 RAM card slots (128K

cards shown, said to support up to 4 megabytes), 128 pin computer direct port (all address, data lines, CPU control, etc.), modem connector (for optional internal voice/fax modem), keypad/mouse port. Of course to maintain the small size, nearly all connectors were shrunk and non-standard types.

o An excellent gray-tone LCD display. It did not appear to be backlit which would make sense for the battery life. This was said to be greater than 10 hours before recharging. With less hard drive use, it would be longer.

o The replaceable battery pack shown was very small and contained about eight AA alkaline batteries. If Ni-Cads were installed, the universal power supply would also recharge them when connected. When the battery pack goes down, the notebook is automatically put in a halted state that is maintained for weeks until recharged. Internal Ni-Cad batteries will maintain the halted state of the computer for about 5 hours if the battery pack is removed from the computer.

o Atari has a few choices to transfer data to and from the computer. Connect an external floppy drive. Transfer over the serial ports with a modem or direct. Transfer over the parallel ports at around 20 Kbytes/sec. Connect an ACSI device such as a hard drive externally or possibly ACSI to ACSI communications.

ST PAD

This is similar to ST Notebook and shares most of the features but has a futuristic interface. A touch sensitive LCD display with a pointing device was shown for mouse type functions and handwriting recognition for input. Physically, ST Pad looked like the "Etch-a-Sketch" drawing toys that we grew up with minus the X/Y knobs. No keyboard was attached and there is not an internal hard drive. The OS software and large amount of scratchpad RAM were said to have Artificial Intelligence features to allow ST Pad to actually learn your handwriting style! (Good luck with mine.)

ST Pad looked like it needed more time for completion but ST Notebook looked like something we may actually see sometime this summer or fall. With this exciting new innovative line of computers and Alwin Stumpf (from Atari GmbH) heading up a new world-wide marketing campaign, it appears that this time Atari really may be backing the promise with the product.

Yes, there is one here. Try looking at the following:

~atari/graphics/50hzboot.prg (too small to bother arcing)

boyd@nu.cs.fsu.edu (Mickey Boyd) writes:
>Um, does anyone know how to figure out what postage to put on the SASE?
Yes.
>Do the stamps have to be German?
I think the german Postal Offices accept only german stamps...
> Could I just include $5 or something?!?
I think $5 will be enough.

Well, the postage for a letter is DM 1.- within Germany (if you keep the
weight below 20g which is improbable with a 3.5" disk, DM 1.70 for a
letter of up to 50g).
Depending on the weight the international airmail fares to the USA are
DM 1.65 for 5 g
DM 1.90 for 10 g
DM 2.15 for 15 g
DM 2.40 for 20 g (1.40 + n*0.25 per 5 g up to 20 g)
DM 3.35 for 25 g (2.10 + n*0.25 per 5 g up to 50 g)
DM 3.60 for 30 g
DM 3.85 for 35 g
DM 4.10 for 40 g
DM 4.35 for 45 g
DM 4.60 for 50 g
DM 5.55 for 55 g .... (the table is longer than that,
... ... I'll try to save bandwidth now)
DM 127.- for 2000 g (this is MAXLETTERWEIGHT).
Is it that what you wanted to know?
By the way, 1 US$ is currently about DM 1.60 (rising).

2208. GDOS .fnt file formats

Newsgroup: comp.sys.atari.st
Date: 1991-03-14 08:37:57 UTC
From: rosenkra@convex.com
Message-ID: <1991Mar14.083757.13185@convex.com>
Source record: 233912
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

thanx to the myriad folks you pointed out that GDOS font files are more
or less identical to in-memory or .fed font file formats, just with all
int/numerical data byte swapped (a la [braindead] intel - yuck :-).

i have written a trivial byte-swapper for converting these files, and if
i get a chance to clean it up, will post it. it should work in both
directions.

now, for those of u interested in nroff, read on. others can skip.

i have decided to upgrade nroff to be more a ditroff rather than an nroff.
this means support for lasers, filters, etc. it also seems the most
current *roff technology. however, i was sort of thinking of using
TeX fonts, to minimize the amount of font data on disk (for those with
TeX anyway). this is not quite portable, however. would u prefer unix
compatibility or common font data? hopefully i will still be able to
support nroff-style documents (fixed width fonts) via the propper
tab* and/or /usr/lib/fonts/dev*/* files (-Tcrt, for example). note that
i know that there are probably ditroff config files for TeX and/or DVI,
so this may be an alternative approach, too.

some people have already sent me their wish lists (thanx). now is the
time to enter yours. i am starting the rewrite now.

[suggestion of 50hz booter deleted]

The TV is flipping because the program successfully set the video to 50hz
already and the TV is having trouble syncing up. A 50hz booter won't help
the situation. You really need to be able to tweak the vertical hold...
I'm sure the TV has the control internally. (Dunno, maybe these modern
all-digital ones don't. Haven't looked.) Just fyi, another reason to switch
to 50hz - you get 100 more scanlines on the physical display, of which the
ST can use maybe 80 more, max. But also, getting vertical blank interrupts
at 50 instead of 60hz probably does free up a chunk of CPU time...

total aside... I'm looking into hooking up a 25" Proton monitor/receiver
to my ST. This model has an RGB input, so it oughta look pretty slick.
Apparently new video equipment is all going with S-connectors, tho - anyone
have a nice kit to convert RGB to YC video?

2210. Re: problems with pd game 'Goldrunner'

Newsgroup: comp.sys.atari.st
Date: 1991-03-14 09:44:07 UTC
From: jamie@defoe.enet.dec.com
Message-ID: <2699@shodha.enet.dec.com>
Source record: 233914

"Goldrunner" isn't PD. It was sold by (I think) Microdeal in the UK.
There's also a successor; Goldrunner 2 + scenery disks.

It's a really good shoot-em-up, though Goldrunner 2 isn't so hot.

So perhaps your suggestion to "avoid" Goldrunner is a little premature;
if you had an original copy you would have had no problems!!!

Jamie.

2212. Re: Obstinate Mice!

Newsgroup: comp.sys.atari.st
Date: 1991-03-14 10:30:50 UTC
From: nico@cs.ruu.nl
Message-ID: <1991Mar14.103050.5074@cs.ruu.nl>
Source record: 233916

In <UbrPw_a00VIFA3Q2YN@andrew.cmu.edu> mc4c+@andrew.cmu.edu (Mark Choi) writes:

>when you try to move the mouse pointer to quickly in GEM, the mouse
>starts to accelerate in the intended direction, then does an aboutface,
>and heads in the other direction, and keeps doing this until you slow
>down. This is quite annoying. I keep forgetting to check it in Mac mode
>to see if it is GEM or the hardware controller. Probably lame GEM. I

The problem is in the mouse itself. For both directions, there are two optical
detectors. If you move the mouse, a small wheel with holes in it rotates along
these detectors. If you move, say, left, then first detector A will detect a
hole, and some time after that detector B. The time between the two pulses
is determined by the speed of the movement. If you move the mouse to the
right, first detector B will give a pulse, then detector A.

```
A B detectors
v v
#####################wheel
#O#####O#####O#####O#holes
```

Thus, pulses come in `packages' AB (left) or BA (right).
But if you move too fast to the left, the circuitry in the mouse will combine
the B pulse with the A pulse of the next `package', which results in a BA
(right) package.
This is similar to the stoboscope-effect which you sometimes see on TV: A
rotating wheel appears to rotate in the wrong direction.
The only solution is: Buy a better mouse.

From: iadt3tb@prism.gatech.EDU
Message-ID: <24316@hydra.gatech.EDU>
Source record: 233915

OK, I wasn't paying attention then. I didn't expect to get a hard disk
anywhere near this soon.

Configuration is this: MegaST 2, TOS 1.4, Seagate 277N and ICD ST Host
Adapter, and PC-Ditto (the software only version). I can't get PCDitto
to use the harddisk to boot from. This is what I've done so far
Formatted and partitioned the disk.
Set up drive 'C:' as the boot partition for ST use.
Started PC-Ditto from floppy.
Formatted 'C:' using 'format c: /s' while in PC-DOS (3.3).
Put the ICDBOOT.SYS file back on 'C:'.
Put all the rest of the PC-Ditto programs on "C:'.

The system boots from the HD (as 'C:') in ST mode just fine. PC-Ditto
executes from the HD just fine, but demands that a disk with DOS be
inserted into drive A. I remember reading about some problems and fixes
or work-arounds for using a HD and getting PC-Ditto to boot properly.
As I said above, I wasn't really paying attention. HELP! What did I do
wrong, or what did I not do that I have to?

Thanks,

Terry Banks

P.S. Thanks, Ken. The drive works great!
TB

From article <7868@crash.cts.com>, by chuckie@pro-odyssey.cts.com (Chuck Schul):
> anyone know much on the atari lynx and how it is doing worldwide?

Hmm. Nice thing, color, sound, could have been a success. If not Nintendo had thrown it's GameBoy into the market. No Color, a little less sound, but astonishingly small, much cheaper (that's what impresses the kids, i think) and up to now some 20 Games available, far more than for the lynx, new ones coming continuosly.
Lynx lost the battle, at least here in Austria. Must become smaller and cheaper and be there before Nintendo builds a color GameBoy.

I haven't had an overheating problem yet, but I have noticed that since I upgraded my 1040 the top left side of the vented area feels extremely hot after running for an hour or so. Can anyone recommend a fan that uses it's own power supply that can sit on top of the vented area and cool the ST? My hard drive is already loud enough so a quiet one would be most desired, but I'll take what I can get. Please include model number and source.

About two weeks ago someone mentioned a muffin fan and left the price model number and the 800 number of the company. I called them but they were out of stock.

You probably have 1 or more bad bits in the addon memory.
Remember, 1 bit is in each of the 16 chips.

When the bit goes bad, so goes the programs running in that memory; and you
lock up. On reboot, TOS does a memory existence test to size the machine.
Your memory does not read back what TOS wrote, so the memory is truncated
at .5Meg.

This happened to me. I wrote a simple C program to write/read back memory
starting at 0x8000 and soon found a bit being dropped. (write 0xffff to see
if a bit comes back 0, then write 0x0000 to see if a bit comes back 1).
In my case 1 bit was usually a 1. (it was floating). I replaced the
corresponding chip and all was well.

You sure do have a bug! You have the mouse inversion virus. :^)
Every fifth time you swap disks, the mouse will, as you say, go up
instead of down and down instead of up. Neat little critter. I
highly recommend you get a copy of George Woodside's Virus Killer. I
think the latest version is 3.81.

A friend rang Power Computing(UK) and asked if Revolver was STe (TOS 1.6) compatible. They said that they had had various results/responses i.e. it appears that it works on some STe's and not others, but nobody knows why...

Could be different environments (I think their answer was based on customer feedback), but it sure sounds wierd to me.

Jason.

2225. PC copy to ST-formatted disk

Newsgroup: comp.sys.atari.st
Date: 1991-03-14 20:25:11 UTC
From: fast@spot.Colorado.EDU
Message-ID: <1991Mar14.202511.24612@colorado.edu>
Source record: 233923

I ftp'd some software for my ST 520 here,
uudecoded it, and, on an IBM PC, de-arc'd
it.

Is there any way to copy the program
*.PRG from the PC to a disc formatted by
my Atari? I have no modem for the ST.
When I copy the program onto a disc formatted
by the PC, then the Atari can't seem to
handle it...

This would be nice but why doesn't someone take a standard ansi C library
and make a shareable version taht can be loaded at boot time and there
after used (Via a trap for example) then with the appropriate binding
the text size of executable could be reduced by the size of the linked
library. How about a coff loader for TOS and dynamic linking :-)

Lots of folks have asked for posting of ARGV spec. I found it in the GEMINI 1.2 distribution in DOCS/EXARG.DOC You can get the GEMINI 1.2 distribution from atari.archive.umich.edu, where it's inscrutably called "boottech.lzh".

I'd like to know where is the spec for XBRA?

Thanks in advance.

ST Informer had a screen shot and small description about Tempus Word in their rumor column. The screen shot showed a line of text in a 'wave' pattern, instead of a straight line. (This was in an issue from a couple of months ago.) I think the manual and the commands are all in German. :^(

Nonetheless, Tempus is FAST!! I think there's a demo of it at atari.archive.umich.edu under the filename TEMPUSDM.LZH. Don't know which directory.

I have heard from many people that Goldrunner is not PD. I plan on calling
Joppa (where I got my drive) and asking them why they bundled commercial
stuff on my syquest cart.

I know that software -usually- cannot damage hardware, but this is not written
in stone. Early Commodore machines had weaknesses this way. The Apple][
may have never surpassed the Commodore PET as an educational machine in
elementary schools were it not for a rom-frying POKE statement in CBM basic.
It was all too easy for enterprising students to bake their machine with
just a few keystrokes. I don't remember how it worked, only that it did.

I don't think my machine has been damaged, but only that it fails to forget
things when I turn it off. Right now it is at its normal, unexpanded 512K.
All is normal except for one broken pin on the mmu. It worked 100% fine
for about a week, even without the pin. (I assume that pin is for addressing
higher memory, which I don't have right now.)

Makes me kinda wish my ST would zero all memory locations at bootup like
the good ol' 8bits do :-)

Arrrgh! Does anyone know of a grammatical preprocessor this guy could use?!?
Sheeesh! As per your query, I would highly recommend Stunt Car Driver. Really
fast, really smooth 3-D graphics . . . Also, this game is a blast if you
direct connect two ST's together and play two player. Also, the best driving
simulation (most realistic feeling) that I have played is Sega's Super Hang-On
(motorcycle racing game).

There are great, fast, powerful programs out there for the ST. The problem
is that there is also a lot of crap, and product support is frequently ripped
out from under you. If you pick carefully, you will not have to put up with
slow software. The purchase of a software accelerator can greatly increase
the usability of most applications. I know what it is like to get burned, but
since I started subscribing to Current Notes and reading comp.sys.atari.st,
I have not purchased a lemon. As one netter said, "this newsgroup is worth
a million bucks . . ."

2238. TT (vapor)

Newsgroup: comp.sys.atari.st
Date: 1991-03-15 08:01:26 UTC
From: jwalsh@csd4.csd.uwm.edu
Message-ID: <10247@uwm.edu>
Source record: 233808

Does anyone know when the TT will be available in the US, and why the H*ll it is taking so long. I have heard that the Amiga 3000 is a *much* better, and faster system then the TT. I am beginning to get the feeling that Atari is verging on bankruptcy. They have never offered support for any of their products, what makes people want to spend $3000 for a system like this?

Also, what do people think of what Dave Small said about the TT? "you can't set the monitor on top of the CPU....etc."? From the Genie developers sig, it seems that the TT has the same chip seating problem as the ST (try dropping a $3000 machine).

2241. Quitting GEM. How is it done?

Newsgroup: comp.sys.atari.st
Date: 1991-03-15 11:31:47 UTC
From: adamd@rhi.hi.is
Message-ID: <2904@krafla.rhi.hi.is>
Source record: 233946
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Sometimes it is difficult to avoid having to run GEM programs. I would like to be able to junk GEM during a session without having to reboot, so that the memory can be used for something else. It is fairly easy to stop GEM and get on with something else in the underlying shell (just send KILL -17 to it), but my attempts to quit GEM result in a system crash shortly afterwards. Indeed the MiNT docs warn against killing GEM dead, but it should be possible if the right precautions are taken. What is necessary to do first so that GEM can be successfully removed without trashing the system?

Open for discussion.

2242. QL Emulation on ST (Summary)

Newsgroup: comp.sys.atari.st
Date: 1991-03-15 11:47:45 UTC
From: dh130@cs.city.ac.uk
Message-ID: <1991Mar15.114745.19093@cs.city.ac.uk>
Source record: 233820

A few weeks ago, I mailed usenet with info on ql
emulation upon the st. Ignoring the discussion of can it be done as well
as why it would want to be done the following replies came back:

Source of Info: d8klojo@se.chalmers.dtek
Comments:

He states that: A QL with trumpcard is required. A dump of
the ql rom is required, of which will be transfered to the ST
(copyright laws???, I think he meant dumping of trumpcard rom)

JM Rom will soon be supported.

Info on how to dump roms and transfer will soon be detailed.

General Info:

The QL-screen is emulated in monochrome by a multitasking job.

It reads and writes QL-disks, but no error checking is done on writes.

Format does not work yet.

Serial comm, MIDI etc are NOT implemented yet.

Turbo, Desktop Publisher, The Editor, PSION Xchange and most other
applications work just fine.

Some games, for example Scrabble, are ok, but many are not.

The speed with screen emulator at priority 32 is about the same as my
QL with CST-ram.

Important news:

I have decided to put the current version of the program in the public domain,
but I don't think it's good enough to be posted to .binaries yet.
You could consider it a beta-release.

ST Requirements: 1Mb
e-mail : d8klojo@dtek.chalmers.se
address: Johan Klockars
Foreningsgatan 32/408
411 27 Gothenburg, SWEDEN

O--0--0--0--0--0--0--0--0--0--0--0--0--0--0--0--0--0--0--0--0--O

Source of Info: adamd@rhi.hi.is (Adam David)

Just in case anyone else out there needs this information,
the non-PD QL emulator for the ST is available from:

Jochen Merz Software
Im Stillen Winkel 12
4100 Duisberg 11
Germany

tel: ...49-203-501274

O--0--0--0--0--0--0--0--0--0--0--0--0--0--0--0--0--0--0--0--O

There was also talk of a hardware emulator available, but I do
not have fuller info on this. Also the price was around
ENG$120.00. Personally, I shall buy another monitor and permaset
my QL.

Hope this is of help,

Andrew Thompson

> adamd@rhi.hi.is

Yes it can, the Sector Length byte is 03 for 1024,
Note, I think the Germans use the 22 sector format to get this size,
but you will have problems booting with a 1024 sector, the TOS does not
suport that size,
But have seen some use od a Driver and a Mix of 512 and 1024 sector size.
From what I now, the -02 Part No. for the WD 1772 was for the Atari
none standard step rate, but I could be wrong.

Note , Atari does not use the WD1772-01 step rates of 2/3/5/6ms,
but use 2/3/6/12 , this I think is why the Part No. is WD1772-02

Try reseating the MMU, as they do get dirty contacts, also Note, that
Atari now fit Clamps to hold the sides of the Sockets in..
its wise to do the same to the Glue...

WEL
Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, and STacy.
There are also emulators for the Apple Macintosh and IBM PC/XT/AT available.
Finally, there is the Lynx (a game machine) and the Atari TT and ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:
```

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

CSAST
What sort of articles would interest people reading comp.sys.atari.st?
==========

The most interesting articles are technical articles, impressions of software/hardware, information on Atari user-groups and shows, or helpful hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better than...', especially when cross-posted outside of comp.sys.atari.st. If you don't know how to eliminate other newsgroups from a reply to an article which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local distribution of comp.sys.atari.st. Those outside the United States have little desire to read about that neat bit of [hard/soft]ware you're selling when you live in the U.S.A. If you don't know how to restrict distribution of a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

PD
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter password>
cd /atari

For anonymous FTP in the UK: uk.ac.lancs.pdsoft

User pdsoft
Password pdsoft

This is a national public domain archive, available to sites in the UK only via JANET. Mail access is available from within the UK - send mail to archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: ftp.Informatik.Uni-dortmund.DE
[129.217.64.63]

Some selected Atari ST software is in the directory pub/comp/atari-st.

NOTE: The server has moved from unido.informatik.uni-dortmund.de. FTP
requests to the old address direct you to the address given above. I do
not know the current status of the old mailserver, but would appreciate
learning if it still exists.

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU
programs ported to the ST (including ports of emacs and bash and an extended
version of bammis library for gcc) and also ports of software posted to
comp.sources.unix, alt.sources and comp.sources.misc.

For anonymous FTP in Europe: archive.cs.ruu.nl
[131.211.80.5]

How to get ATARI-ST/index from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be
a valid internet or uucp address. For bitnet users name@host.BITNET
usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between
about 20.00 and 0900 UTC).

ftp archive.cs.ruu.nl [131.211.80.5]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
cd /pub
don't forget to set binary mode if the file is a tar/arc/zoo archive,
compressed or in any other way contains binary data.
get ATARI-ST/index

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

For Mail Service:

For the panarthea mail server, see Steven Grimm's monthly posting.
Panarthea holds all of the comp.sources.atari.st/comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so.

ARCS
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are
binary files which may contain one or more other files in a compressed format.
Archive files usually take up less disk space, and for this reason have
become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive
program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the
/atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features
and quite a lot of documentation
lharc.arc
zoo_bin.arc

Julian Coleman recently (December 1990) uploaded an archive starter pack to
the atari.archive server. His announcement reads:

" I have just uploaded an archive starter pack to Atari.Archive. It contains
the following :

arc / lharc / uud / uue / zoo
U. Michigan monthly posting (05 Dec 90)

The file is 'starter.tos' and is in the form of a self-extracting lzh
archive, so only needs to be downloaded (in binary mode !) and run. The
archive contains sudirectories and needs about 350k when extracted."

This is probably the easiest way to get hold of the various archiving programs
if you have access via FTP and can transfer the binary file to your Atari ST.
The program is located in the main directory (ie. /atari/starter.tos)

There are also several GEM programs which act as 'shells' for the archive
programs. The most popular are Shareware offerings, also available on
atari.archive server. They are:

arcgsh35.zoo - written by Rainer Klute. e-mail will reach him
at klute@irb.informatik.uni-dortmund.de or
klute@unido.uucp, or klute@unido.bitnet

arcshl23.arc - written by Charles Johnson

Both are located in /atari/archivers

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use the command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?' or 'h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

ERR
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1

```
Drive not ready.................-2
Unknown command.................-3
CRC error.......................-4
Bad request.....................-5
Seek error......................-6
Unknown media...................-7
Sector not found................-8
No paper........................-9
Write fault....................-10
Read fault.....................-11
General error..................-12
Write protect..................-13
Media change...................-14
Unknown device.................-15
Bad sectors on format..........-16
Insert other disk..............-17
Invalid function number.........-32............1
File not found.................-33............2
Path not found.................-34............3
No handles left................-35............4
Access denied..................-36............5
Invalid handle.................-37............6
Insufficient memory............-39............8
Invalid memory block address...-40............9
Invalid drive specified.........-46...........15

No more files..................-49...........18
Range error....................-64...........33
Internal error.................-65...........34
Invalid program load format....-66...........35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

```

PAINT
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

GDOS
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and
more)" by Douglas N. Wheeler from the atari.archive server. The file is
/atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server.
The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files
or font files (at least those supplied by Atari). You can get these files
with many commercial programs, such as Degas Elite, WordUp!, etc. You might
also want to check your local user group to see if they received a copy of the
WordFlair demo program (also available on GEnie). The demo program appears to
have the GDOS system and font files.

CLI
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor
BASH GNU Bourne Again Shell - available under MINT
gemini MUPFEL is the shell used by the gemini environment
pcommand an MS-DOS-like shell

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

TEX
Is TeX/LaTeX available on the Atari ST?
=======================================

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.0) has recently been made available on the
atari.archive server. The files may be distinguished from the other TeX/LaTeX
files in the /atari/tex directory by their date (posted in December 1990) and
by the fact that they are all archived using LHArc (.LZH suffix).

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

LANG
Public Domain/Shareware languages...
====================================

Check the atari.archive server under /atari/languages. Currently included:

abc
apl Demo and 'J' j_29.arc,apl68000.arc
forth Don't know which, I prefer BRADLEY FORTH
FORTRAN77 BC-FORTRAN version 'C' bcf.lzh
icon ICON icon2.arc,icon_bin.arc
modula-2 From Germany modula2.zoo
Sozobon C Most excellant
Elan
xlisp

xprolog
xscheme

GNUC
Is GNU C available on the Atari ST?
==========

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems. For more than minor programming, you may need to upgrade to 2 or more megabytes, as the GNU programs generally assume you've got plenty memory.

GNU C for TOS is available via anonymous FTP on atari.archive. It is also available via anonymous FTP on cs.uni-sb.de [134.96.7.254] and most of the other European FTP sites.

MINIX
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.

If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

DEV
How do I become a developer for the Atari ST?
==========

Contact Gail Johnson, Atari Rep Person, (408)745-2568

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Gail for
more information.

ZNET
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get
copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg
Lindahl provides an excellent service to the networking community by sending
these out.

ZNET and some information from the Current Notes user magazine are also
available from the atari.archive server under /atari/magazines.

PALS
ST Pen Pals list
==========

Simon Chappell is compiling a list of people interested in exchanging
paper-based mail "of interested parties who could then
keep in touch and prevent themselves losing touch with the ST community
at large (this would be especially easy if someone who still had net
access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

BOOKS
What books are available for the Atari ST?

TIPS
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already

have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

==========

I would appreciate feedback, comments, suggestions for more TIPS AND HINTS, etc. E-mail can reach me at the following:

Sorry for this but I did quote the Wrong BBS software, it should have been STar-Net, and not Nite lite, my brain was not into gear.

By the way, what ever happend to FoRem Elite ???, this was suposted to have multi line support...

Hi Neodesk users,

I saw many postings about Neodesk 3.xx. I am very intrested in
Neodesk, and i would like to get a copy of it.
But, when i went to my local atari dealer, they don't know
where to get Neodesk 3.xx. Does anyone know where to get
this software package in Europe?
Is there a dealer in the Netherlands?
And what is the latest version of the software, does it run under
TOS 1.4.?

Thanks in advance.

Geert.

Send posting to UUCP : ...!hp4nl!ahds!geert

Ocean's new game "Epic" used to be Microdeal's sequel to "Goldrunner 2", aptly called "Goldrunner 3". Microdeal, in the middle of development of "GR 3", decided to get out of the software market. Ocean promptly bought the rights to it, and released it as "Epic". I believe it is now out as we speak. I have seen some screenshot of it in ACE magazine, and it looks awesome!

2254. Changing GEM rez on the fly?

Newsgroup: comp.sys.atari.st
Date: 1991-03-15 15:15:26 UTC
From: adamd@rhi.hi.is
Message-ID: <2912@krafla.rhi.hi.is>
Source record: 233805

I saw a few months back some discussion here on whether this was easy to do. I didn't pay much attention to it then, but now I have reason to regret not having kept those files. As I remember, the problem is that GEM needs to be told about the changed screen resolution because it is not enough to call the BIOS Setscreen() routine. I recall some mention of internal GEM variables needing to be tweaked. When the BIOS resolution is changed from low to medium, GEM attempts to use the lefthand side of the med-rez screen as a low-rez screen giving funny colours.
Does anyone have the details or other useful info about this?

2256. A Beginner's Guide to FTP

Newsgroup: comp.sys.atari.st
Date: 1991-03-15 15:44:03 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Mar15.154403.18191@terminator.cc.umich.edu>
Source record: 233812

This is a beginner's guide to ftp. It is intended only to get you on your
way to ftp happiness. Please let me know if you have any comments,
questions, or suggestions.

weiner@atari.archive.umich.edu

Jeff Weiner's FTP Basics Vol.1 #1

Part 1: Logging in
To begin an ftp session, the first thing you need to do is log in to our
machine. You can do this by issuing the 'ftp atari.archive.umich.edu'
command. You should then see something like this:

Connected to atari.archive.umich.edu.
220 atari.archive.umich.edu FTP server (Version 4.169 Wed Jan 2 17:03:56 EST 199
1) ready.
Name (yourhost.domain.edu:yourusername):

At this prompt you'll want to type 'anonymous'. On some hosts, the word
'guest' will work, but 'anonymous' is always a sure bet.

If you don't see this login prompt, but instead get something like
'Our host was unable to trace a name back to (some internet address).
We only accept ftp from properly registered hosts', then you'll have to
ask your sys-admin to properly register your machine in its name servers.
There's nothing we can do on this end, so please don't bother asking.

Assuming you recieved the above prompt, you'll then be asked for a
password. Use your mail address. For example, I would use
'weiner@atari.archive.umich.edu'

Part 2: Basic Commands
Once you're logged on, there's a few basic commands you'll want to know about.

ls : lists the names of files of sub-directories in a directory.
dir : does the same thing as ls, but is needed on some other machines
ls -l : A verbose listing of files. Includes permissions, filesize, etc.
cd : changes directories (i.e. 'cd atari' would put you in the atari area)
cd .. : Goes 'back up' a directory, to the one you came from.

These are about all you need to get moving around the archive.

Part 3: Getting the Goddies

The main reason you want to ftp in the first place is to quickly transfer
files. More often than not, you'll want to transfer the files from
the archive to your account. You can do this using the following commands:

First, find the file you want to download.
Second, issue the command 'type binary'. This tells our machine that
you'll be transferring a binary file.
Third, issue this command 'get <filename.ext>'. This will instruct
the archive host to send <filename.ext> to your account.

The last thing you'll want to do is use the 'quit' command. This
tells our machine you're no longer interested in ftping files, and would
like to go back to your command prompt.

Part 4: A Few Words on Net Ettiquette

Net Ettiquette is something that every net user should be aware of.
Relating to ftp, and our archive, it is essentially this:

1) Try to keep ftp usage to an absolute minimum during business hours,
in our time zone. That would be 9 am to 5 pm , EST. This roughly means
upload or download on file and little else during these hours. After
5pm, have a blast. Go nuts. We probably won't mind nearly as much.....

2) If you have a question about some aspect of ftp service or some
other area of your computer, please ask around at your site first. Don't
immediately fire off all of your questions to us. I don't mind answering
questions about the archive, problems with logging in, or something
similar. But I tend to get upset when people ask me questions like,
"Jeff, how come I can't get the fgrep command to work properly on
my sparc station...."

3) Please try to upload files that you know the archive doesn't have. I
know it's not the greatest thing to do, but if you can find time to
download stuff, I think you can find time to return the favor and
upload things also.

If you have any reasonable questions, any comments or concerns, etc.
please mail them to me, weiner@atari.archive.umich.edu.

Thanks,
weiner

Taking so long? It's a grand old Atari tradition, isn't it?

My dealer had one in the store the other day. But not for sale -- it belonged to a VAR who was showing it off. VARs appear to be getting them ahead of dealers. The VAR in question packages Atari equipment and custom software for driving numerically controlled stitching machines (making bowling shirts and other uniforms with writing stitched on them). I suppose that there's no danger of such a machine winding up in somebody's home and offending the FCC radio interference zealots.

Hey,

I also have had problems with the SC RAMdisk when run on the Atari side
I find that the more operations I do within the RAMdisk, the more likely it
is to start acting as though the <ESC> key is pressed and stuck. It just keeps
refreshing and theat obnoxious keyclick goes constantly. Sometimes I can stop
it, but generally I must abort the entire thing and reboot. Perhaps this has
something to do with NeoDesk (I hope not, because I will never return to
Atari Desktop). Anyone had trouble with this? Also for all you modem users,
I have seen a version of Procomm kicking around that is setup for the SC, I
have as I suspect most of you do, the use of an IBM close by. Simply take the
regular Procomm and modify parameters to use COM2, this is <ALT> P. Then
save it, it will work perfectly on SC the first time and no bother of
downloading what for some reason is a much larger file.

I'm interested to hear what people have been doing with their SC's
please E-mail. Also anyone know about that expansion bus inside the SC, it
is standard? If it is, their is a great possiblity of running cards off it
I would suspect.

2260. wp2latex for the ST

Newsgroup: comp.sys.atari.st
Date: 1991-03-15 18:15:29 UTC
From: ate@cs.ruu.nl
Message-ID: <1991Mar15.181529.8003@cs.ruu.nl>
Source record: 233804

I've just compiled wp2latex on my Atari ST.
Wp2latex converts a Word Perfect (5.0/5.1) file to LaTeX.
I've put the program in our Atari archive. The package includes docs and
sources (Pascal and C). You can get the file by anonymous FTP or by our
mail-server.

*****> by anonymous FTP:

Site: archive.cs.ruu.nl [131.211.80.5]
Login: "anonymous" or "ftp"
Password: your email address (you@your_domain)
Usage: see the ftp(1) manual on your system
File: pub/ATARI-ST/tex/wp2latex.zoo
Important: don't forget to set binary mode.

*****> by our Mail-Server program:

1) The Mail-Server can be reached at the address

mail-server@cs.ruu.nl

or the old-fashioned path alternative

...!uunet!mcsun!hp4nl!ruuinf!mail-server

2) The Mail-Server understands a couple of commands, all commands
must be in the message body. The first thing you might want to
do is ask it for help:

send HELP

3) The Mail-Server will send you the UUENCODED package
if you put the following commands in the message body:

begin
send ATARI-ST/tex/wp2latex.zoo
end

PLEASE NOTE:
I didn't write the program. Ron Helwig (rcronh@urc.tue.nl) did.
I only made it work on a ST.

Enjoy,

- Ate -

>after used (Via a trap for example) then with the appropriate binding
>the text size of executable could be reduced by the size of the linked
>library. How about a coff loader for TOS and dynamic linking :-)

This could actually be done fairly easily; the main issue is what to do with program references to library data. You would have to either change all the compilers to make such references indirectly, or make the linker smart enough to copy the data (like errno) into your program, and have the runtime system smart enough so that the shared C library can reference data in your program. The latter is nontrivial.

Also note that the libraries needn't be loaded at boot time; the startup code for the program could load libraries as appropriate, thus allowing arbitrary libraries to be shared on demand.

As for static data in shared libraries, that is usually implemented in Unix implementations by the same "copy-on-write" mechanism used by fork() for program data segments.

2263. Re: SM124 Monochrome monitor problem (an another one).

Newsgroup: comp.sys.atari.st
Date: 1991-03-15 22:40:28 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440163@hplsla.HP.COM>
Source record: 233818

```
| I recently purchased a 'previously owned' SM124 monochrome monitor. It seems
| to work quite nicely except for one minor problem. When the display is a
| black background and there is very little text on the screen, the image is
| quite dim. As more characters are displayed the image brightens as if the
| brightness control were being turned up.
```

I received e-mail from one Ian D. Hawkins who apparently can read this group but not post to it. With his permission I am posting his explanation and solution for this problem...

"It's easy to fix the fading problem. It's caused by the drifting of the cathode supply voltage. This is fed to the card on the end of the picture tube to a connection marked b2. It should stay at 70 volts, but drifts high when the screen is nearly black. the grid thus appears more negative and so the current drops off. Fix it by regulating the 70 volt line with, for example , a couple of 36v zeners in series. They dont draw much current, only a few mA. V2 and V3 are ground connection on the tube-end pcb."

2264. ST with video problem

Newsgroup: comp.sys.atari.st
Date: 1991-03-15 23:50:23 UTC
From: bobw@hpsad.HP.COM
Message-ID: <750117@hpsad.HP.COM>
Source record: 233844

I recently bought a used 520ST with JRI SIMM memory upgrade board as a second machine. It seems to have some sort of video problem. Some programs don't clear the screen correctly. They work just fine on my other machine.

Example: using Flash the right mouse button can be pressed to toggle between the terminal and the save buffer/GEM pull down menus. Press it a second time and it should restore the terminial. The problem is GEM menus and other graphics associated with that screen don't get cleared.

Example: the DeskJet accesory tool by Jeroen Scheerder leaves little remenates of its window when closed.

Example: the Spectrum slide viewer spcsli.prg only shows garbage.

Any ideas?

-Bob

2265. monSTEr and MGR

2266. Re: TT (vapor)

Newsgroup: comp.sys.atari.st
Date: 1991-03-16 00:57:25 UTC
From: csc23042@sumax.seattleu.edu
Message-ID: <2472@sumax.seattleu.edu>
Source record: 233824

The article was somewhat different that what I would expect from START- but I can trust Dave Small to give a honest appraisal of things.Hopefully they will fix the monitor/case interference/support problem. I like the wealth of serial ports on this machine, and indeed the large number of interface ports overall makes for a lot of possibilities. The twin fans look nice too- should make it rliable.

The point I thought was strongest was the pricing scheme.Now true Atarians will much rather buy a TT than a Mac even if the price is same. But if you are trying to convince new people to sign on, then Atari has to (if they can) revive the spirit of the orginal ST. This would be something like the TT selling for $2000 w/monitor. Look, I don't know exactly what price point it should be, but recall in the old days of 1985 when you could buy a ST for $899 w/monitor that would outperform the corresponding PC or MAC (Mac Plus, IBM AT) at 2/3 to 1/2 the price.
It looks like the main Atari philosophy is to beat their competitors price. They can still win a great victory doing this. If the new Mega STE is sold cheaply enough (undercutting the Mac Classic) then they have a really good shot at reclaiming market share. Greg Pratt seems to have grasped this, at least one interview suggested this, of beating the equivalent Apple product at every level (save perhaps for the IIfx.) They have the machines to do it. The ST or 1040ST can be really slashed to dominate the low-end. The Mega STE can hold off the pitiful Mac Classic. And the TT can (if the price is lowered) either outperform the Mac II LC or beat the IIsi in price (this will be a harder fight, because it is tougher at this level to make the advantages of your machine apparent,as opposed to the feeble Mac Classic.)
The TT is solid hardware. I would not waste too much time with Unix, unless they can push a Unix box out the door for $2500 or less (thus giving them a all new price/power point to deal from.) They should really go for the hack and slash here. I don't think there would be as many complaints about Atari service/support, if the machines were being sold at price-war prices, like the old c-64 was. The price-slashing strategy might be the best one for them and the Tramiel philosophy. Either that, or ax the Tramiel sons. Proof that nepotism does not pay.....

>the good ol' 8bits do :-)

Hmmm... sounds like there may be deeper underlying problems.. the ST *is* supposed to zero out memory when you run a program... that's what Pinhead is designed to prevent (and avoid the long wait while 2.5 or 4 megs are cleared every time you run something).

Have you tried a memory test program like Supra's MEMTST..?

BobR

(That POKE in the early Pets would turn the built-in monitor's brightness up excessively and burn it out... nasty..! There was another case of software harming hardware in early Radio Shack Color Computers.. you could POKE the clock speed higher.. nice for games, but it could overheat the LSI chips... but those are the exceptions...)

>cause the location of the drive parameter block in RAM varies with the
>TOS version.

Surely there are sensible ways of finding where these are located, if this is what's needed. Since it is possible to have separate steprates for drives A: and B: then there must be a reliable method for changing the steprate on individual drives. Install the routine into the mediach vector, it's almost there now.

>>Does anyone know whether the WD1772 can handle 1024-byte sectors?

>This can be done in software. The WD1772 will read and write 256, 512
>and 1024 byte sectors. TOS will only work with 512 byte sectors.

Presumably the BIOS handles various sector sizes by using the BPB. Is TOS really limited to using standard sectors? What about hard disks which also have larger sectors? (or do they all use 512-byte sectors with more sectors per cluster?). In the worst case a few routines will need to be patched or rewritten if there are indeed incompatibilities. Besides cramming more data onto the disks, being able to use 1024-byte sectors gives access to disks written on other systems which use this format.

Hello yet again,

I am currently trying to home-brew an HD/Floppy system for my 520ST I bought an HD case (it's coming in the mail) and I already have an 85MB HD and ICD host adapter. What I'd like to know are what peoples experiences with using 3.5" drives normally used with IBM's? I'd like to know how you hooked it up, where you got your parts, what problems you had, any hints, etc. I'd also like to know what brands worked best, which to avoid, and how much you paid for the whole mess. Finally, I was wondering what experiences people have had with the DreamPark or other 1.44MB floppy upgrades. I'm interested, but I've heard of certain incompatibilities that arise.

Please e-mail me, but I'll summarize my findings if there is interest.

> The problem is in the mouse itself.
> The only solution is: Buy a better mouse.

I don't think I agree that the only solution is to buy a better mouse. I tried it with my mouse to see if what you said was true. Well, it was, but I didn't know about it previously. Why? Because I use a mouse accelerator program in my auto folder and have NEVER had to jerk my mouse that violently to get it to respond properly. So, I would submit that you might not need to buy a better mouse if you get a good mouse speeder upper program....

The following opinions are my own and not those of anyone else who might be registered on fquest.fidonet.org. All flames can be sent to alt.flames since we don't read that here.

I want to convert an ASCII file, which is being created on an Atari computer, to an ASCII file readable by an IBM_PC DOS. The point is that I want to know if there is a utility that would make it possible for me to make the file readable on the IBM_PC and therefore make it possible to be converted to a DOS compatible text.
I have done this before for a Kaypro computer, by using a utility called Uniform, however I have not found anything for Atari. Thanks in advance.

This is a real pain in the neck. One way to minimize this si to always
hold the reset button in while you reboot, like it mentions in the
manual. This is also a pain in the neck, and a mark of bad design, but
is less annoying than that repeated ESC. The bus is NOT standard, nor
could it be, in that sapce, but the new 80286/386 add ons supposedly
have the abitity for an external expansion cage for standard ISA cards.
This does include the use of SVGA with a SVGA monitor etc.! Too bad we
can't use them in standard Atari mode. :^(.

No I don't know, but I've got one...they came out in europe 1.9.90

I have heard that the Amiga
> 3000 is a *much* better, and faster system then the TT.

Well, if you HEARD so then how come you don't buy one at instant ?

I am
> beginning to get the feeling that Atari is verging on bankruptcy.
>
WOW, then my TT would be a real collectors item ?!?!? $$$$$

They have never offered support for any of their products, what
> makes people want to spend $3000 for a system like this?
>
That's true ! not even in finland.... but that's probably why
it seems that the most dedicated usergroups, with GNOLEGEABLE
users have formed around st/TT -here (ST-club with it's PD-
librarys, monthly diskmagazine, developers meetings etc...)
I think the st/TT being not the "safest" choice, it has dropped
out many teenager kids who mostly play games (and used to use c64
and use amiga now) and PC/MAC type of users.... ST/TT is more
distinctive type of thing... this flaming about amiga/st/TT being
better or not is like arquing between cars: wether SAABs(st/tt)
are better or worst than VOLVOs(amiga) but they both are better
than LADAs(russian car and (PC/at/386/486) and are in totally dif-
ferend price group than mercedes(mac) ???? I just happen to like
saabs... and there's a certain destinction between most saab drivers,
which aren't always that good. (here they say "SAABism is a desease!")
;-) but usually the ones who never drove one ;-) ;-)

> Also, what do people think of what Dave Small said about the TT?
> "you can't set the monitor on top of the CPU....etc."?

again... this takes a little brains and coordination, but with that
the monitor sits nicely on top of the central unit (why would you like
to open covers and sit it on top of the cpu... for keeping it warm ??)
-> I imagine that would be a little hard...but then..... ;-) ;-)

I have a feelin the person also wonders about the "pen holder" in front
of the machine... and what to do with it...?

From the
> Genie developers sig, it seems that the TT has the same chip
> seating problem as the ST (try dropping a $3000 machine).

What's that problem, while I'm not aware of...?
>
>
> Another unsatisfied customer
(not quite, you gotta buy something first ?)
(Potential customer, maybe ?)

have lafs & merry weather
Verbier got three days of snow !

GEM installs a lot of interrupt routines without allowing a legal
deinstallation of them. So I think it is *not* possible at all to
deinstall the Graphics Manager. (BTW: You'd only win 40 K -- not
more, I don't think that this small amount of memory is worth the
effort)

nico@cs.ruu.nl (Nico Verwer) writes:
> The problem is in the mouse itself.
> The only solution is: Buy a better mouse.

Well, let me point something out. I have a buddy that bought a nice ST mouse (not made by atari, I cannot remember the manufacturer), and we noticed a slight problem. The dpi tracking speed of mice has become a marketing buzzword (i.e. "hey, ours tracks at 400dpi, wow"). Well, that means that for some constant distance the mouse moves, a higher dpi mouse outputs more values for that movement (thus resulting in the mouse pointer moving farther). You commonly see "you don't need an accelerator with this mouse". However, there is a problem. With his mouse (400dpi), the pointer did seem to move at about twice the speed of a normal atari mouse, and if you moved the mouse quickly (as an experience desktop user would), the hardware handling the mouse values would apparently get overloaded and poop out. What would happen is that I would move the mouse around doing normal file operations, and occasionally the mouse pointer would just kind of 'freeze'. By experimentation, the speed of movement was determined to be the culprit. Thus, my friend now has need of a mouse decellerator to be able to use his nifty mouse (and this may not work either).

To sum up, don't be impressed with large dpi values. In fact, stay away from them!

I wish to note that "moving the mouse fast" was not artificially induce, just my normal operating speed when I get cooking. You can even overload the Atari mouse if you really sling it around (not recommended). The point here is that the higher dpi mice don't need to be moved nearly as fast to get this to happen.

Also, as per the "better mouse" argument, I would like to note that I have one of the newer Atari mice (with the nylon rollers and the round ball door on the bottom), and it has performed flawlessly for 2 years. The older Atari mice were prone to 'wear out' quickly, but the new ones seem solid and reliable (hey, I hve really given this one a workout).

2285. Moniterm monitor

Newsgroup: comp.sys.atari.st
Date: 1991-03-16 23:35:23 UTC
From: hofmann@cbnewse.att.com
Message-ID: <1991Mar16.233523.15734@cbnewse.att.com>
Source record: 233831

Well, I just purchased a Moniterm Viking 2/91 monitor. It's a huge beast (19" diagonal) and I hope it's worth it!

I've had no problems with the hardware, just the software I've tried to run on it. Gulam, for instance, insists on keeping the command line about halfway down the screen and writes its responses below that line. Uniterm doesn't work at all.

I posted a query on moniterms
before, and those who responded had no such problems which makes me wonder which screen driver Moniterm users are using? I'm using the one from Atari, bigmontr.prg and someone told me they had problems with it. Are other drivers available? Where?

Any hints you Moniterm users can throw my way will certainly be appreciated, as I would like to switch over to the Moniterm as soon as possible for all of my work.

Thanks!

Source record: 233837

As far as I know (and I've done a few file conversions, IBM to Mac to Atari, etc.) you don't need *ANY* utilities to convert ASCII text from the Atari to the IBM. Atari ST's use *almost* the same file format as the IBM 3.5" format. Just format the disk on the IBM, pop it in the Atari (Ataris seem to always like IBM disks while IBMs occasionally gronk on Atari formatted disks, and hey, don't format it at 1.44 Mb!) and save your text, ASCII format.

Then, stick the disk in the IBM, do a "dir", and your file should be there. You can see it with Mess-Dos "type" command, and if you get an MS-DOS word processor that reads ASCII (most can) then you can do fancy things with it (like add fonts, boldface & stuff that doesn't convert well.)

It's *REALLY* easy.

2287. gcc-ar woes

Newsgroup: comp.sys.atari.st
Date: 1991-03-17 02:58:31 UTC
From: es2a+@andrew.cmu.edu
Message-ID: <IbshhLu00VADIIZ2Ev@andrew.cmu.edu>
Source record: 233838
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just recently got my 4 Mb system, and I just tried gcc-ar for the
first time. It doesn't seem to work. With everything in the right
place, the following occurs:

```
% ar r libab.olb abcd.o
Creating archive file `libab.olb'
ar: access denied for libab.ol$
cmd exit code 1
%
```

... and a very small file named libab.olb is created. A file named
libab.ol$ which is a few bytes larger than abcd.o is also created.

The version of gcc-ar I am using is the one that's in the bin.zoo
from terminator (gcc-1.37).

Any help is appreciated.

2288. GCC: Virtual memory exhausted error?

Newsgroup: comp.sys.atari.st
Date: 1991-03-17 03:51:03 UTC
From: es2a+@andrew.cmu.edu
Message-ID: <0bsiSby00VADAIpl4O@andrew.cmu.edu>
Source record: 233839
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I'm running gcc from RAMdisk on my 4 Mb system, and am playing a balancing game between disk space and memory. I have been getting an error from GCC, namely "Virtual memory exhausted." Does this really mean "disk space exhausted," as it seems to imply, or does it mean "not enough memory?" It doesn't seem to matter which version of gcc I use, be it 1.37 or 1.39.

Thanks in advance,

-Eric Stuyvesant

Hi!

csuab@warwick.ac.uk (Steve Strong) asked:

> I've just been digging around on terminator, and found a program called
> vdifx110.lzh. I guess this is some sort of VDI fix, but alas, all the docs
> are in German. Can some kind soul tell me what bug this fixes, and if I need
> it. I've got TOS 1.6.

You'll need it. It fixes a bug in the v_opn[v]wk()-routines of TOS which causes
confusion of attributes. The only versions that don't need this patch are
TOS 1.2 (really!) and the new TT-TOS.

WOW. I was thinking of getting a STacy, assumit ever passed FCC
and the price came down.... This may be exactly what I've always wanted.
A miniature ST that I could bring into my classes to take notes and play
nethack on. Too bad I'm graduating this semester. It'll still be nice to
take on trips, when I have to be away from my home system.

No big deal about no disk drive - I hardly ever use my SF314 anymore anyway.

Any idea at all (give or take $500US) how much this baby will cost?
Guess I'll find out in about 1-2 years, when it hits the US market.

2294. Atari.archive.umich.edu monthly posting

Newsgroup: comp.sys.atari.st
Date: 1991-03-17 15:58:37 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Mar17.155837.24668@terminator.cc.umich.edu>
Source record: 233855

Welcome to atari.archive.umich.edu

This is the monthly posting from the umich atari posse. We hope
it will answer some of those nagging questions that always seem to pop up
from time to time. If you have any additional suggestions, please mail
them to me, at weiner@atari.archive.umich.edu.

1: How do I use BART?
Now that BART is back on-line again, you can get bart help by mailing
atari@atari.archive.umich.edu and include the word 'help' in the body of
the message.

2: How can I connect via FTP?
If you are interested in ftp, I recently wrote a beginner's guide. Please
mail me and I will send you a copy. I'll post it every once in a while too.

3: What if my machine doesn't support name service?
Two things to do here:1) Demand that your sys-admin install it soon,
and 2) use the internet address 141.211.164.8

4: I can't download because my hard drive doesn't work and my modem goes
out sometimes and .....HELP!!!
Sorry, outside of the archive I really can't help you....Your best bet is
to find someone at your site with a similar set-up, or post to c.s.a.st
for advice.

5: HEY! Your index is much better than it used to be!!!
HEY! I know! We've added text descriptions and a whole lot more! To top
that off, the index will now be updated instantaneously. No more waiting
for me to get off my butt and do it....But, keep in mind, it's still in
the creation process, and will be a bit wierd from time to time. If you
have noticed any errors, or have any suggestions or descriptions of files,
please mail them to me!!

6: When I try to FTP to the archive's host, I get a message saying that my
machine wasn't recognized and I wasn't allowed to log in. What's up?
We only accept ftp logins from recognized hosts. If you are not allowed
to log in, please try again. It is possible that the DNS took a bit too
long. If you are still denied access, ask your sys-admin to fix your
name servers.

7: Ok, the index is better, but I can't find a thing in ~atari/utilities.
What's up there?
I'm in the process of reorganizing this directory. It just got a
bit too big and out of control to be really useful. I should be done
with it by the 2nd week of April.

8: Here's a question for you Jeff, how come I can't use 'ftp terminator.cc.etc'
any more to connect?
That's because you're not using atari.archive.umich.edu like we told you
to. In the near future, terminator.cc.umich.edu will change it's name.
Don't say we didn't warn you.......

There are a few files you'll really like to have:

archivers/arc602.arc : The latest version of arc
archivers/zoo.arc : The classic archive program
archivers/compress.zoo : Useful for removing .Z from sounds and binaries
archivers/unlzh11.arc : Unpacks .lzh files
archivers/sttar.arc : Removes those nasty .tar extenders
THEY ARE CONTAINED IN THE SELF EXTRACTING ARCHIVE starter.tos!!! PLEASE USE IT!

Thanks to everyone who has uploaded anything lately.....

Just Added: ~atari/reviews: A directory devoted to reviewing new and old
atari software, hardware, PD, shareware, etc. Please send your reviews
to me asap.

PLEASE NOTE: FTP service is a privelege, not a right! Please make
a supreme effort to keep heavy FTP use in off-time hours (i.e. after
5 pm EST but before 8 am EST).

Any ideas, questions, comments, etc. to me,
weiner@atari.archive.umich.edu

>

You'll have to restore all the various interrupt vectors that GEM changes when
it starts. These include: the line F vector, the mouse vector, trap #2
vector, critical error handler, and gemdos timeout vector. There are probably
others as well. If you've killed GEM and any of these interrupts happen, the
wrong thing could be done (leading to a crash).

> system working.

There's not much that can be done without recompiling either MiNT or MGR.
The problem is that MGR uses MiNT's V:\MOUSE device to do mouse I/O,
and when this device is open mouse events aren't passed on to GEM and hence
the line A variables that most big screen emulators use for scrolling aren't
updated. The next version of MiNT will update those variables automatically.

It shouldn't be necessary to do any conversion. Atari and MeSs-DOS
both use straight ASCII characters with lines terminated by a CR-LF
combination.

But if, for example, you created your file on the Atari with First
Word Plus in word processing mode, that's a different question
completely: how to convert First Word Plus documents to ASCII? Is
this your problem or did the above paragraph answer the question?

>period of time (5 years, think, but perhaps depending on the property and
>jurisdiction), you no longer have the right to protect it.

Legal question 1:

Do the property rights devolve to the usurper, or can the original owner still sell, transfer, lease, (or license) it to others?

Legal question 2:

If neither of the above, wouldn't the property become "Public Domain"? (Though I cannot think of a physical analogy for this, the trademark analogy would be: if you defend your trademark, you can prevent it from being used by others. If you do not defend it (within a certain period of time) it can be used *by anyone*. Thus the constant battles about using trademarked terms in a generic sense (coke(TM), polaroid(TM), xerox(TM :-) etc.).

2301. New uploads to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-03-17 21:00:08 UTC
From: boyd@nu.cs.fsu.edu
Message-ID: <1991Mar17.160009.28770@mailer.cc.fsu.edu>
Source record: 233859
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Here are some new uploads to atari.archive (141.211.164.8):

size name

24320 areacode.lzh Find city and timezone from phone areacode. Very
handy for decoding your phone bill!

15872 bigcolor.lzh big monitor emulator that works in color.

38391 cal47.arc An excellent calendar program. Allows you to install
a "reminder" program in your auto folder to warn you
of upcoming events (I will never forget my girlfriend's
birthday again!). Very well done, this is a must have.
This version is only a few hours old!!

16896 djenvelp.arc Prints envelopes on Deskjet printers

16923 dskchart.arc Gives a graphical representation of free disk space on
drives. Can also give more detailed info.

28544 edhak_19.lzh This is a combination diary/text editor/memory editor/
disk editor. I think it is an acc.

37760 edhakdoc.lzh Fuller docs for the above program.

23808 fcopy30.lzh A german PD copy/formatter program. Very nice.

108672 nagel.lzh A bunch of Nagel spectrum pics. Very well done.

16512 postal20.arc A database of postal abreviations for US and Canada.

5756 specshow.arc A spectrum pic viewer. Also allows you to compress
the pictures, and view the compressed ones.

36864 stunzip.arc An ST version of the ZIP archiver.

116352 subcl114.arc A PD version of El_Cal, a very user friendly and
powerful mathmatical calculation program. A must
have!

54272 tcos.arc A stripped down clone of Hypercard. Kinda interesting.

Please note that I had nothing to do with any of these programs except for
Cal47, for which I merely made some suggestions to the author. I really
recommend this program, it is actually USABLE (as opposed to all the other
time management type programs I have used for the ST). Sub_Cal is another

gem in this group. I used a previous version heavily in several of my undergraduate calculus, statistics, and discrete math courses. Enjoy!!

Oh, on a couple of these guys I added a small doc file (if there was not one included with the arc). Just a one or two liner.

Source record: 233861
Cross-posted to: rec.music.synth,comp.sys.atari.st,misc.forsale

Software for ATARI ST MIDI

Master Tracks Pro (one week old - not what I needed)
original box, etc. (bought for $289)
UltraMIDI total control workstation (MidiMouse Music)
Never used - controlled midi prompting from your synth
(cost $249)
MichTron SuperConductor Sequencer ($49)

Sell as Package for $300 or $175 for either of the first two, and the first
reply will get the supercharger program thrown in. Would rather sell as
a set though

Also:
Stereo Leslie style effects generator
Foot button style switch. Mono input, stereo output

I bought it used and have not even tried to hook it up. I ended up
running mono anyway, and thus have not had a need for it. I paid $35
dollars for it on the network, and would like to get $25 for it.
mono input, and stereo output. Power plug included, or run on batteries.

Source record: 233847

> Would someone(s) care to offer their opinion of Sozobon C vs. GNU C? Do
> one or both have a source-level debugger which can be used with them?
> If so, are they included with the "package"?

If you've got the memory (>=2 megs) and a hard drive, GNU C is definitely
the way to go. It produces better code, is ANSI compatible, and offers a
choice of 16 bit (for speed) or 32 bit (for compatibility with Unix) integers.
The libraries for GNU C are also somewhat more complete, and are generally
more Unix-like.

Neither compiler really offers a source-level debugger. szadb (the sozobon
debugger) doesn't do source, although it does do symbol tables. gdb
(the GNU debugger) *is* a source level debugger, but the current release
for the ST is very seriously out of date, and lots of problems are reported;
in my experience, it can't be relied on.

> if you get a good mouse speeder upper program....

Yes. I use the Mouse accelerator that comes with GEMINI.

IT IS NOT A MOUSE `DOUBLER'. Those things are horrible - they just
make the mouse move two pixels rather than 1 on each pulse, so the mouse
jerks around the screen.

The Mouse accelerator I use goes at normal speed when you move
the mouse around, but if you move it, say twice as fast, it steps up
the speed and travels (say) four times as fast.

Really neat.
Warwick.

>
It means "Real memory exhausted" on the ST, since we don't have any virtual memory. (Although if you have a TT, and write the necessary software, this could change...)

I find gcc usually wants 2 megabytes; if your functions tend to be large and complicated, 2.5 megabytes may be necessary.

2307. Re: Obstinate Mice!

Newsgroup: comp.sys.atari.st
Date: 1991-03-18 00:27:35 UTC
From: mc4c+@andrew.cmu.edu
Message-ID: <Ubt0Zr600VBAIOW281@andrew.cmu.edu>
Source record: 233864

As per all the replies to my original post, all very interesting, but academic, as I have a STacy, and us the trackball more than a mouse. I can get it ot overload during normal operation (I do move the bugger FAST, I know what I want to do!), but it is even worse with a trackball, as the normal operation procedure is to flick the ball and let it fly. This results in a lot of "hurry up and wait" sessions, as the mouse goes nowhere. I think that it is indeed a hardware controller problem, not really a mouse or accelerator problem. I have two mice, the Atari and the Best mouse, and the trackball, and the Atari accelerator, and this occurs during any combination of the above. The problem is in the box! Oh Well....

Message-ID: <8bt19Ui00VBAQOW2Z2@andrew.cmu.edu>
Source record: 233865

I have a STacy, and believe me it's nice, but it ain't that great. Mac laptop? a bit of a pain in the ass with the cartridge and the GCR floppy wire hangin' off the sides. But this thing from CeBIT. I waannnnttttt it. I want it now. THIS is what the Stacy shoulda been. But from the decription it seem as if a few things may be lacking. External monitor support for one. So how do I do colour? Also, RF. What about cartidges? Would they have to be redesigned to be direct slot cards? That would not be so bad. Think, GCR as PDS card, faster, no need for goofy bankswitching to get more than 128k, and internal! Greyscale? will there finally be a hi-res greyscale, ore does grey-tone only man that the LCD will be grey, not blue? Why no floppy? other ntebooks got 'em? A back-light is a necessity. The STacy is unusable without it!
All this aside, this baby sound great. If they allow it to access the full 4096 colours of the STe, then they can give the STacy a sex change operation, and call the new machine the STacey. WOW.

2309. STOS/CyberSCULPT help

Newsgroup: comp.sys.atari.st
Date: 1991-03-18 01:18:18 UTC
From: mc4c+@andrew.cmu.edu
Message-ID: <gbt1JOK00VBA0OW31r@andrew.cmu.edu>
Source record: 233866

I have a bit of a problem. The program files on my original STOS disk got damaged. I live in the US, and have had no luck finding to whom I send the disk to get it replaced. I would appreciate one of the following, preferably the first:
1) Could I mail my ORIGINAL disk to someone who has STOS, so that they can reinstall it?
2)If not, does anyone know where I can send my disk in the US to get it fixed.

Actually The same thing happened to my CyberSCULPT disk (Yes I do use backups, this is just a fluke) Is there someone who can do the above (#1) for SCULPT as well? Thanks in advance. :^)

Also, to Dave Small, and the folks at GRIBNIF. You guys seem to be fighting it out on my STacy. When I use the feature of neodesk to load an alternative desktop font, the Spectre page in mac mode is garbled and FUBAR. It still works though :^|. Since I only use it for reassigning the right mouse button, it's not that big of a deal.

That wouldn't help. It would probably break the program, especially if the
program in question was an arcade game.

> Also, an explanation of
>why the programs change the frequency in the first place would be appreciated.

European TVs work at 50 Hz. We make up for the fewer frames per second by
having more vertical resolution and properly-encoded colours. One of the
things which amazed me about US TV on visiting the US was that it really was
as bad as it looks over here. I had always assumed that it looked all
blurry and smeared because of some defect in the NTSC->PAL conversion.
It really spoilt "Cheers" when they went from film to grotty US video.

The only solution to your problem is to get a better TV, I'm afraid. My Sony
works at either 50 or 60 Hz. I gather that Atari monitors work at either
speed, as well... and of course, a multisync will handle it with no trouble.

2311. Ultimate Screen Saver/Mouse Accelerator

Newsgroup: comp.sys.atari.st
Date: 1991-03-18 03:57:55 UTC
From: vanleejf@udcps3.cps.udayton.edu
Message-ID: <1991Mar18.035755.26503@udcps3.cps.udayton.edu>
Source record: 233869

What could arguably be called the ultimate in screen savers and mouse accelerators is now out, HotSaver. It was written by the Codeheads and it's shareware (unless you own HotWire). It allows for just about every variation on a screen saver possible, as well as multiple set-ups for the mouse. It is available at atari.archives as soon as it gets cleared.

2313. TeX help

Newsgroup: comp.sys.atari.st
Date: 1991-03-18 05:24:50 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Mar18.052450.9498@chinet.chi.il.us>
Source record: 233868

The following replies to my request for help setting up TeX on the ST may be of general interest. I'll add that the man pages on atari.archive are extremely useful in configuring TeX.

From: Michal Jaegermann <gargoyle!ugw.utcs.utoronto.ca!NTOMCZAK%UALTAVM.bitnet>

As far as I know there is no book which entiltled "How to run TeX on ST", but generic setup should work. There is a number of different TeX implementations for Atari, so it is hard to give a more concrete advice. Environement variables should be good for a lot of things.
On the other hand your questions are easy.
As far as Metafont goes - you can try something on screen if you have program version which supports that. So far I did not see one for ST although I heard some rumours that they exist. All which I have just makes fonts from Metafont programs. With just posted by Steve Grimm gawk 2.11 I included, as one of examples, an awk program which generates gulam script for Metafont driving. Adjust to your needs and have fun (you may need to create your own modes).
Differences between virtex and initex. You are using normally virtex which is a real program. initex is a sort of formats compiler. You do not want to load big macro packages everytime from scratch. With initex you may just get macros and :dump, producing .fmt file to be read later by virtex.
I have aliases like 'alias tex virtex &plain', 'alias latex virtex &lplain' and so on. initex has its own index entry in TeXbook. Check also page 343.

Cheers,
Michal

If you are going to use METAFONT, you had better get the METAFONT book also.
If you have any specific questions, I know TeX pretty well, and I even have
it up on an Atari (although I don't use the Atari version much). I know very
little about LaTeX. I read the METAFONT book once, and I know it is not too
hard to use METAFONT to make new sizes of fonts that someone else already
designed.

If you have set up TeX from one of the public domain distributions, here is
roughly what you need to do.

1. Get everything dearced and put in the right places.

2. Try
tex filename.tex
on some test file that is real simple (tex filename when you have a file
named filename.tex should also work). If you don't have a test file, use
the next four lines:
This is a test.

\bye

3. The result of step 2 should be to produce the file filename.dvi
If that works, you have TeX working and (for producing dvi files) you are
limited only by the fonts for which you have .tfm files. The main other
possibility is that you get some message about it can not find the font
cmr10. I guess there is also a slight possibility that you are using a
version of TeX that does not have the plaintex macros built in. In that
case it probably wants to read the plaintex macros first. Let me know if
you should be having that difficulty and I will see what I can do to help.

4. If you have your dvi file, the next thing to try to get going is a dvi
previewer. This will display your document on the screen. I have one of
those going, but I don't remember which one (I can check if you wish). The
early dvi programs only worked on black and white monitors, but now some
work on color too (though not as well).

5. Lastly, you will want to be able to print. For this you need a print
driver. I don't have any working, but I am interested in what you get
going. I believe that there is a free driver for the Epson printer.

Your dvi previewer and your print driving program need not only tfm files
(which tell such things as how tall and wide each character is) but also some
font files (which tell where to put ink on the page). Different drivers use
different formats. The first file formats developed was the .pxl format,
which contains a bit map of each character. This format is big but fast to
work with. The .gf font files are more compact, but drivers that use them
must unpack them at some time or other. Anyway you need the type of font
files that your previewer and printing program expect. There are programs
with obvious names to convert from one format to an other.

Once you have TeX, the previewer, and the printing program going then you will want to consider METAFONT. It takes definitions of fonts (in files whose names end in .mf) and produces .gf files. The easiest thing to do with METAFONT is to produce different magnifiactions of fonts. Once you have a correct .mf file, you can change a few parameters (maybe just one) to get a .gf file for letters of what ever size you want. Good font definitions also have parameters to adjust for how black the dots on your printer are. See the METAFONT book for details. If you want to really get fancy, you can use METAFONT to design your own fonts.

Please keep me posted on your TeX effort and let me know if I can help. If you want really complete information, join the TeX Users Group for $45. They have complete back issues of their journal.

> IT IS NOT A MOUSE `DOUBLER'. Those things are horrible - they just
>make the mouse move two pixels rather than 1 on each pulse, so the mouse
>jerks around the screen.
>

Just to differ, I rather like my mouse doubler. It does nothing in low res, doubles the x-axis movement in medium, and both x and y axis in high res. This means that you get the same amount of relative pointer movement as mouse movement in all resolutions.

> The Mouse accelerator I use goes at normal speed when you move
>the mouse around, but if you move it, say twice as fast, it steps up
>the speed and travels (say) four times as fast.
>

Now, these proportional accelerators really annoy me. I constantly miss stuff when I start cooking with the mouse. I find that I have to try two or three times just to grab a file, or hit the trash can. Maybe I just move too fast for the damn things (the one on the NeXT boxes drives me nuts!).

I used to think "more is better" when it comes to mice. I have now sobered a bit. I want something constant! Consistency breeds speed. As I have noted in previous posts, the "higher dpi == better mouse" scam is another basically stupid thing you can do with a mouse!

Just IMHO. I didnt want all those pd and shareware authors to think that EVERYONE likes the proportional mouse accelerators (since many utilities are starting to include some sort of mouse acceleration).

Oh, here is another one: you do something with a mouse (like click a button), and the damn pointer jumps to another part of the screen (supposedly so I do not have to move it myself). Arrrrrgh!

I AGREE TOTALLY. Anybody who writes programs that do this, and don't provide
a way to configure without `mouse-warp' should be shot.

It takes longer to visually find the mouse again than it would to move it!

I need help!!!!!!!!

I am using my ST and CAD-3D to generated an animation that is for a
school project. The animation NEEDS to have animated text!

I do not have Cyberpaint, and I cannot do this in DEGAS...it MUST be
in 3D!!

I have scanned the ENTIRE GeNIE libraries and just about every FTP
site I can find to get ahold of a font for CAD-3D.

If ANYONE of you have a font, or know of where I can get one PLEASE
let me know!!!!

I tried making one and it looked like shit....

Again, this is for a school animation project and I am running out of
time....please help....

The reason that I hate them is thus....

I work at a video store during the summer called Movies Unlimited.
They are a 5 store chain based in Philadelphia. While I was working
there (before I started college) word got out that Blockbuster was
coming to the Philly area, but we didn't know where. We found out.
Right across the street!
They opened Christmas day!

[flaws begin]

They (blockbuster) say they have over 10,000 movies.......
reality- if they have 50 copies of BTTF3 then that is 50 movies,
etc...

M.U.: (the store I worked at) carries aprox. 19,000 TITLES!!!
(if we have 20 copies of a movie it counts as ONE TITLE!!)
(the catalog has over 23,000 TITLES!! see pg 127 of April

Premiere mag)

The staff at BB doesn't know sh*t about movies!!!
I asked them for movies that I KNOW were available and that M.U.
carried, they (BB) were clueless!!
(we did spying on them to see what danger we were in....NONE!)

When BB first came in, we did see a drop in new members. About a month
later we saw an INCREASE in new members. BB does mass mailings to
canvas the neighbourhood. People would come to see BB and then notice
across the street and see us and come in and join.

MU runs it like this....
membership is $19.95
you get...

4 free 2 night rentals
free catalogs (reg & adult)
rental freebie card (stamped for each title paid for
reguardless of when returned)
10% discount on ALL purchases (blank tapes, vids or LDs)

a VERY movie-wise staff
and free popcorn

in other words.....

IT'S A REAL VIDEO STORE!!!!!

I was in the same position for some years.
I could read many newsgroups, but was not allowed to post.
Even email outside the company was not allowed.
This was for security reasons of the research center I was then.

I think many people are in that same situation.
And you know what the *worse* thing to happen is:

Someone posting a very interesting article/question to the net
and you will never know what the answer is...
It is even worse that the people say, if you are interested
let me know (by email). But you can not do that!!

So please, I am asking for all of these souls,
Reply to the net always, unless:
- it has already been on the net recently,
- or when it is a private matter.

And when email is still done: Summarize to the net!!!

As far as I know, in my neightbourhood, more people can only
read the net than post to it as well.

Sigh, I may be on another project soon, and
may have only read access to the net.

libab.ol$ is, actually, what you are looking for. I had the same problem
with gcc-ar until I recompiled it with Eric Smith's MiNT library (the
panacea for program woes). Just rename libab.ol$ to libab.olb and you'll
have your archive.

It might also mean that you are hitting the 40(+) folder limit. Try
increasing the number of folders available with folrxx.prg (or you
hard-disk driver) and see if the problem disappears.

2322. Re: What's the BEST CLI for the ST

Newsgroup: comp.sys.atari.st
Date: 1991-03-18 13:48:40 UTC
From: david@doe.utoronto.ca
Message-ID: <1991Mar18.134840.1617@doe.utoronto.ca>
Source record: 233883

Another problem with shared libraries is integer size. It would be possible
to have the program end of the interface translate most function
arguments consistently to 16-bit or 32-bit integers, but there are serious
implications for functions like printf().

2324. New standards for MiNT programs?

Newsgroup: comp.sys.atari.st
Date: 1991-03-18 14:09:01 UTC
From: david@doe.utoronto.ca
Message-ID: <1991Mar18.140901.1919@doe.utoronto.ca>
Source record: 233882

It's time for us to start designing programs and libraries which will run under future versions of MiNT which support bigger and better file systems. A good idea might be to include some dummy system calls which MiNT-aware programs can use to replace Fsfirst(), Fsnext() etc. The new system calls should work the same for now, but require a much larger buffer for the program name. That way, in the future when MiNT supports better file systems, MiNT programs will not have to be recompiled to be able to support names like Nethack.Source.tar.Z. If we just put all of the calls in place now, our work will be easier in a year or two.

Comments? Perhaps we should write a spec sheet for what programs/libraries should do to be upwards compatible with future MiNT versions. This is something that we can do together on the net, and all Eric would have to do is approve it and include it in the distribution.

> smart enough so that the shared C library can reference data in your program.
> The latter is nontrivial.

This is true but with limitations this could be simplified. Really when we
deal with libraries they are pretty much black boxes, what we get depends
on the implementation. Errno is really the only real problem point in the
whole C library and ANSI defines it as an Lvalue Macro so any implementation
which lets you write errno=87 will be ok. So if the library contains no
reference to _errno then the global reference to the volatile name in the
programs space will be used by the library. The real problem then is having
the library know which errno to use at any time. This would have to be to be
context sensitive.

for example when a new process is started a pointer to a
process link table be generated with all this type of data.
This variable is kept in the process table in the OS and installed as
the current application binding at each context switch or at each p_exec
eg

```
typedef struct process_static_table {

int * errno;
struct fileblock fb;
int etc
char **environment
...
...
} ptable;

ptable c_library;
context_pt=&c_library;
```

For user generated libraries, such static references are banned

the errno Macro then in the library may be
*(context_pt->errno)

alternatively we can have
*(get_errno_ptr())
where get_errno_ptr() is a function in the current programs space not the
library.

ie

int *get_errno_ptr()

ANSI cleared up a lot of this junk

>
> Also note that the libraries needn't be loaded at boot time; the startup code
> for the program could load libraries as appropriate, thus allowing arbitrary
> libraries to be shared on demand.

True, but it _IS_ easier to load them at boot time :-)

Moving sale! Everything must go. My wonderful, reliable 1040st system
is now up for grabs, at this unbeatable price.it.

Atari 1040ST (incl 720k internal drive, midi ports, mouse, etc)
2.5mb main memory (but an additional 1mb usable from supercharger)
Tos 1.4 upgrade
SF314 external 720k floppy
Supra 30mb hard disk with battery-backed-clock
Monochrome Monitor SM124
Colour Monitor SC1224
Supercharger MS-DOS emulator - WITH EXTRA 1MB of RAM!!!!
(runs at norton SI of 4 - works great with Wordperfect 5 and Turbo C++)
CTS Datacomm 2400 Hayes compatible modem/cable

Complete system with manuals and tons of software..... $1800

Send me mail or call me at 514-848-9765. This must be sold by May 1st!

Well, I guess it is something of the form TSR (Terminate, Stay Resident).
I think that it watches for a certain key combination: (ALT+CTRL+I)

Here is the "net" and the "readme":

There is no author mentioned. I know no address to write to.

>From uunet!mcsun!hp4nl!philapd!ssp18!jvl Sat Feb 23 22:58:06 EST 1991
Article: 35494 of comp.sys.atari.st:
>From: jvl@idca.tds.PHILIPS.nl (J. van Loenen)
Subject: Re: printer data capturing
Date: 6 Feb 91 11:49:49 GMT
Organization: Philips Information Systems, Apeldoorn, The Netherlands

Several questions have been posted last week about capturing printer data:

>Does anyone know if a program that can redirect the print-data in a file
>exist ? If yes, any ftp site?

]Get BARREL.ARC from any archive site (I highly recommend our site at

:I, too, am interested in this. I remember hearing about a program called
:barrel (or something like that) that was just the ticket. I looked over the

Months ago I have asked the same question and received many responses.
All of them telling me to get BARREL. I got barrel but couldn't use it,
because barrel captures all the data in memory. So with barrel I could
not "print" graphical on my 1M ST.

Some weeks ago I recieved ICCA. A little program (~3k) able to capture
screen/rs232 or printerdata straight to disk. It works well on my harddisk.
I do not know if printing to a floppy will result in continious switching
floppies.

As icca uses a second screen for the userinterface, allocated when starting
to capture to a (new) file, you may have problems to start it within
programs that allocate all the available memory. If so, start icca before.

I do not know the author of the program. I got it from a dutch bbs:
"Dutchman". The archive contains a program and a little documentation.
Because it is very small, and a lot of users seem to need it, here it is:

Enjoy,
Jan

##
DISCLAIMER:Unless otherwise stated, the above comments are entirely my own
# #
Jan van Loenen Internet jvl@idca.tds.philips.nl
Philips Information Systems UUCP ....!mcvax!philapd!jvl
##

I found this program on "Dutchman", a Dutch BBS. The archive contained
a 'readme' file, how to use ICCA. Here follows the translation:

ICCA - I Can Capture Anything.

Icca is a program to redirect output streams to files. The usage is
as follows:
1. Start ICCA.PRG. The program will return to the desktop immediately.
2. If you want to redirect output, press <Control>+<Alternate>+I
simulatiously.
3. Choose the outputdevice to capture.
4. Type the name of the file. It may contain a path.
5. To stop capturing, press <Control>+<Alternate>+I again. This time
the file is closed.

You can start capturing to another file now starting with 2 again.

2335. 1.44M Drive Woes

Newsgroup: comp.sys.atari.st
Date: 1991-03-19 01:36:37 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Mar19.013637.18313@terminator.cc.umich.edu>
Source record: 233751

I'm posting this for Terry Wells, who doesn't have net access. Please
reply to him, NOT me. Thanks,weiner

I have the Power Drive 1.4M floppy enhancement for my Mega 2. It is my
experience that there is some incompatibility when transferring files to/from a
PC (MS-DOS 4.0). I know that it isn't Dream Park's fault as they didn't
actually write any driver software except for a step rate changer. (And yes,
it does set different step rates for different drives (A/B). But it appears to
install itself differently for different TOS versions as it displays an
"Installed for TOS 1.2" message on my machine.)
The problem occurs when I format the disk on the ST or the PC. The
first 720K of the disk works fine. If I fill the disk past 720K on the PC, the
ST cannot read any of the files that have sectors past the 720K point. The
sectors themselves aren't bad but Cleanup ST by ICD says that the FAT contains
invalid entries. I haven't tried to fill a disk on the ST and then read it on
the PC, but I expect that a similar problem will occur.
Does anyone know what may be causing this? I expect that it has to do
with dissimilarities between the way MS-DOS and TOS handle the FAT for large
(above 1M) disks. For now, all I can do is to use only 720K formatted disks,
but this is a pain. I bought the 1.4M upgrade almost specifically to do 1.4M
floppy transfers from the PC. Can anyone help?
Terry

>... etc.

Thank you on asking that question. I have started a year ago interesting
project (see below), not supported from any institution (as in majority of
computer music projects), which led me to the similar questions.

Problem of STANDARDS in Computer Music. MIDI standard is not enough.
Every day we can see hundreds of new "Music" products whose only purpose
is to take your money out of your pocket. Manufacturers are not thinking
of standards, they need FAST production and large profit.

I don't think that there exists a Standard MIDI File Format. It is also
important to define what kinds of information you would like to see
in such file (multitrack recording of MIDI events, MIDI dump of patch
parameters, music scores of composition, live performance protocol file,
etc., etc.)

As far as I know MIDI Sample Dump Standard is THE only standard which can
be related to 'files' (although it doesn't imply usage of files). It is
more like MIDI Sample Dump Packet Protocol Description.

If you thought of MIDI events recording, and file containing such
informations, I'm afraid that widely accpeted standard DOES NOT exist.

>The information i would like to get is:
>
>1) Are the parameters in the standard midi file machine independant.
> Can all parameters be used on every midi instrument?
>
They should be ! Particular music device drivers should hide all
characteristics of particular instrument. (Layered approach).
Some MIDI instruments, however, are less powerful, so one cannot
expect of all instruments to respond to all possible events.
(Such events should be skipped or mapped into others when possible).

>2) How are the parameters orded in the midi file.
>
Again, I am not sure what 'parameters' are you talking about ?
If you think of MIDI composer/recorder, some hierarchy in file

definition should be higly welcomed, as well as modularity, in
order to minimize duplicate information (repetition of events or
bars or groups of bars).

If you think of patch dump files. Ordering doesn't matter.

>3) Can machine dependant data (for example midi exclusive data) also be
> stored in the midi file, or must i use my own format to store these
> data.
>
This was a project I've mentioned above. I've started writing a
tool which could provide MIDI programmers with a possibility of
producing MIDI applications capable of controlling ANY type of
MIDI device by using Object Oriented definition of Exclusive Data.

To simplify, my Universal Device Driver Code Generator should produce
driver code in plain C language if given simple ASCII file containing
definition of any MIDI instrument. Once you have your application
working with one relatively complex instrument you can be positive
that it should work WITHOUT change with ANY other instrument.
The only thing you should do after purchasing NEW instrument would
be to enter your favorite editor and type in the definition of
your NEW instrument's system exclusives using META language designed
for such operations.

Actual application would use STANDARD library calls like in GKS,
GEM or similar graphic standard libraries (open_virtual_workstation,
send (handle, data), receive(handle, data), ... where handle is
music device ID opened at the beginning of application (or later)).

The answer on your question is YES, but again I am not sure that
there exists a standard (world wide). Unfortunately, I didn't
complete my project, because nobody wanted to pay me, and on the
other side people who are paying me expect from me to do other
things. (I completed parser for META language, and started
code generation, I also defined "standard" formats, all known
exclusive messages should fit in, and I also started to think of
mechanism which could provide you to include in definition file
even new system exclusive message formats which are likely to
appear in the future).

I would like one day to see this or similar system working and
to see happy faces of all music people after purchasing new
instrument and configuring it after just a couple of minutes.

Why should we purchase new device drivers from the manufacturers
when we could define new one in 10 minutes !!!

>4) Many midi music programs are using the standard control commands
> for manipulating the music (such as bender, hold etc.)
> I have not seen a program use control commands that are
> particularly for a midi instrument (such as sound effectors which
> are not descriped in the midi standard).

> Programs must use the standard control commands and the
> 'user defined' control commands for manipulating music
> (i think) to get the most flexibility.
> Is there a program on the market that uses this concept?
>
I hope one day we shall be able to purchase Real-Time Music
Workstation capable of Music/Sound/Image processing. I hope
it will cost less than 2000$ US dollars and will fit size of
my desk. Some simple sound processing control can be implemented
and IS implemented on some Digital Sound Processors. It is often
just simple preset/effect change which is useless in 99% percent
of real life situations. What I would like to see (as well as you)
is real time change in reverberation or delay characteristics
possibly controlled from the external source (joystick or similar
controller). In a year or two Digital Signal Processing technology
will be capable (I hope) of doing such things in real time and for
less than 2000$ dollars.

The problem is when the manufacturers are going to lower their
extremely high prices. (Why some manufacturers of sampling keyboards
are selling hard disk drives (40MB, extremely slow) for 900$ (!!!)
when such drive can be purchased for as low as 200-300$?)

I would also like to easily control tempo changes, dynamics,
timbral characteristics (all in real-time and possibly from the
external sources). AND I WOULD LIKE TO SEE A SOFTWARE PRODUCT WITH
ALL THESE CAPABILITIES WHICH I CAN UNDERSTAND IN ONE DAY, WITHOUT
PAIN of READING 100s of MANUAL PAGES WRITTEN WITH THE ONLY PURPOSE
OF justifying WRONG DECISSIONS THEY MADE DURING DESIGN & IMPLEMENTA-
TION.

That would be all for know. Please forgive me on length of a text.

>but astonishingly small, much cheaper (that's what impresses the kids,
>i think)

No, Nintendo hype (reenforced with NINTENDO POWER magazine) influences the
kids. As for being more competitive, you can now buy a Lynx base package
for $99 here in the 'States (versus $89 for the Gameboy).

Portable game system market so far:

Nintendo Gameboy $89 B&W, 1-2 players
Atari Lynx $99/$149 Color, 1-8-??? players
Sega Game Gear $149 Color, 1-2 players
NEC TurboExpress $300+ Color, 1-2 players, accepts
TurboGraphix-16 games

I don't know nothin' about economics, but it looks like Atari can turn
this into a major rout and kick every other system out of the market. It
all depends on getting more games and good advertising, IMO.

Just sent DiskChart 3.3 to atari.archive. It has a few more useful features
than version 3.0. For example, when you click on the line of drives at
the bottom of the screen, it finds the free space on each drive.

As usual, Atari has all the good games it needs for the thing. It's
an amazing toy, but they don't seem to care whether they sell any...
They've survived up to now on word of mouth, so why not continue
the trend? Who needs big sales anyways?
A pity, it would otherwise be worth developing games for it...
At least the Portfolio is doing well..
I give up on the TT for now...

I'm afraid that what you are saying is wrong. A MIDI file format for
storing the MIDI event sequences DOES exist, and it is currently being
used by many commercial programs. You can get its specs via anonymous
ftp from ucsd.edu. Unfortunately the specs there are pre - version
1.0 (i.e., before it was approved by the MIDI Manufacturers'
Association), but I don't think there is a big difference. Also,
check your favorite MIDI BBS for utilities to convert between
the MFF files and several other commercial sequence formats such as
Cakewalk files.

2342. Re: Setting Floppy Seek Rate in all TOS versions

Newsgroup: comp.sys.atari.st
Date: 1991-03-19 04:44:54 UTC
From: vsnyder@jato.jpl.nasa.gov
Message-ID: <1991Mar19.044454.24718@jato.jpl.nasa.gov>
Source record: 233895
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Here's the poop on setting the seek step rate for floppies, from page 60
of the Rainbow TOS distribution:

"Floprate: - Floprate, XBIOS function 41, checks or sets the seek
rate for a floppy drive. This is new; the seek rate
must be set with (previously) undocumented variables
on earlier versions of TOS.

Floprate example.

```
int devno, newrate;
oldrate = Floprate(devno,newrate);
```

This returns the current seek rate if newrate is -1,
otherwise sets the seek rate to newrate. For doing this
with previous versions of TOS, the seekrate byte
locations for drive A and B are:

OS Version	Drive A	Drive B
0x0100	$A09	$A0D
0x0102	$A4F	$A53

In either case valid seek rate byte values are:

Value	Rate
00	6 ms
01	12 ms
02	2 ms
03	3 ms

This call does not range check the drive ID or new seek
rate. If devno is zero, it assumes drive A:, if
nonzero, drive B:." That's 41 decimal.
You can get the TOS version from offset 02.w from the place pointed at
by 0x4F2.L (_sysbase).

2343. Printer redirection (again?)

Newsgroup: comp.sys.atari.st
Date: 1991-03-19 07:51:56 UTC
From: mtvfb@rivm39.rivm.nl
Message-ID: <1991Mar19.075156.12567@rivm.nl>
Source record: 233889

Hello netlanders,

Some time ago there was a thread on ** PRINTER REDIRECTION ** on c.s.a.st.
I didn't follow it back then, because I had no need for redirection.

But as always, nothing changes as much as the human mind :-) so now
I **AM** interested.
Sofar I have tried the program BARREL from atari.archive, but it doesn't
fill my needs. I have some programs capable of printing, but since I don't
have a fine printer I want to use the printer at work, but I don't want
to bring my ST every time.
These programs don't react to BARREL being resident: the print option is
still disabled. And printing from WordPerfect running under DOS (PC-Speed)
reports the printer being not ready.
So, what I need is a program that makes the Atari think a printer is
connected, although there isn't. Printer output should be redirected to
a file (and not to a buffer that has to be transferred manually to file).
Ideally, this program runs from the AUTO folder, and thereafter I "have
a software-printer" .

Any input appreciated, preferably by e-mail!

Fokke de Boer (mtvfb@rivm39.rivm.nl)

2344. Looking for Logo for ST

Newsgroup: comp.sys.atari.st

From: black@blake.u.washington.edu
Message-ID: <18665@milton.u.washington.edu>
Source record: 233894

I'm looking for a copy of Logo for the ST (520).

Unfortunately Atari apparently doesn't ship it anymore.

Can anyone help me track down any (Atari, 3rd-party-vendor, or public domain)
logo implementations for the ST? (Public domain with C source would be
the answer to a prayer, but any of the above would be great for now.)

Thanks for any help...

2345. Prolog for the ST

Newsgroup: comp.sys.atari.st
Date: 1991-03-19 09:50:53 UTC
From: klamer@mi.eltn.utwente.nl
Message-ID: <klamer.669376253@mi.eltn.utwente.nl>
Source record: 233891

I am forwarding this message for Jens Kilian, kilian@cc.GaTech.edu.

In article <klamer.669316722@mi.eltn.utwente.nl> Klamer Schutte writes:
>When you care about execution speed, you don't want toy prolog.
>It is sssssssoooooo sssssslllllloooowwwww (get it ;-)

That's why it was called `TOY' Prolog by the original authors
(Kluzniak & Szpakowicz); it's also one of the things that made me
NOT change the name after I had completely rewritten most of the program.

If you want a really fast Prolog, try Prolog-68 (comp.binaries.atari.st,
volume 13, available on the Panarthea server). It is about 26 times faster
than TOU Prolog ST; on the nrev benchmark, it almost reaches 12 KLIPS.
If there is any faster Prolog for the ST, I would like to hear about it ...

The trouble with Prolog-68 is that it is a pre-release version; some major
features like assert/retract are still missing, and so is most of the
doumentation.

>Now i use SALIX prolog. It is a commercial (approx. DM 200)
>package from germany. Its fast and reasonably bug resitant.
>The gem interface is nice (It is in prolog and no to slow).

I never got to write a GEM interface for TOY Prolog, it would have been
impossible to uuussssseee iiitttt, anyway :-(.

2347. 40 folder problem

Newsgroup: comp.sys.atari.st
Date: 1991-03-19 12:02:03 UTC
From: fields@uktriton.cray.com
Message-ID: <051358.839@timbuk.cray.com>
Source record: 233761

Does anybody know whether the famous '40 folder problem' is fixed in later version of TOS ??

I have a 4Meg STe with a 40M FA.ST Hard drive, with about 100 folders. Occasionally
files get corrupted, different files get into the middle of files..It looks very much
like the problems when, with my 1040, I encountered the 40 folder problem.

I have tried with foldr150.prg but that didn't seem to change anything, but it could
be because the problem has already happened and until I ZERO the partition it
will continue regardless.

Anybody any ideas ??

Thanks
Mike Fields

>forth.

I found this would happen every fifth time I swapped disks and pressed ESC.
Originally I thought it was a bug in TOS, but then I found my favourite disk
had an executable bootsector. This virus seems to be otherwise harmless and
can be killed with any disk utility which allows you to toggle bootsector
executability.

I got NoiseTracker v1.5 recently. I'm sure it's public domain, so should I
try to upload it to atari.archive? There's nothing in any of the
documentation which suggests I shouldn't distribute it, but there's nothing
which says I should either. It's a wonderful piece of software - I use it
on my STe to play Sound/NoiseTracker modules I've downloaded from a couple
of Amiga Games Machine anonymous FTP sites (ab20.larc.nasa.gov and
mars.ee.msstate.edu). NB if you reply via email, use one of the addresses
in my .signature.

2351. Of Mice and Many Codehead Upgrades

Newsgroup: comp.sys.atari.st
Date: 1991-03-19 14:38:46 UTC
From: whitcomb@aurs01.uucp
Message-ID: <59663@aurs01.UUCP>
Source record: 233772

I am a "power user" of Codehead/LGF software. I use the Codehead
RAM disk with Pinhead and Codecopy to boot up directly from the
RAM disk...really fast.

This is great now that I have it working, but it took quite alot of
tinkering to get it going. At first I'd get several automatic
reboots before the thing settled down, random crashes and so forth.
It turned out that the main culprit was the Atari mouse accellerator
program. I think I tried using all three generations of the
program, and all of them interfered with the boot process. Finally
I just trashed them and got a Golden Image mouse (which tracks
twice as fast) and I've had no problems.

Occasionally I will still find that I've booted up in low resolution
for no apparent reason, but it doesn't bother me much because the
reboot is so fast.

The rest of my setup includes Hotwire!, Maxifile, Multidesk, and
Lookit and Popit. I use Hotwire!/Maxifile all the time, and even
boot up with it as my default desktop. The only time I ever exit
to the atari desktop is to change resolutions. Am I missing a
method that will let me do this in Hotwire? Or is there a
PD program that will do this for me? I don't like to exit to
the desktop after using Mark William's C Emacs, because Hotwire!
crashes when I re-enter it afterwards.

The Little Green File Selector complements the system well, but it
I have found that I don't use most of the feature of the last
umpteen versions.

I recently read that Codehead has just released major upgrades for
Hotwire and Maxifile, and are working on a Utilities upgrade. Has
anyone tried them? My gut feeling is to wait a few months more to
upgrade, because new versions seem to pop up every few weeks.

From: vousten@neabbs.UUCP
Message-ID: <598128@neabbs.UUCP>
Source record: 233775

I just uploaded CALAMUS.LZH to atari.archive. It's the demo version 1.09 of Calamus. Someone on the net asked for it last week. You can't save documents, but it will give you a good impression of what the program can do. (Be prepared: archive contains path names.)

On the same subject: as far as I know, anyone who uploads something to atari.archive will have to send a short description of the uploads to Jeff Weiner (the archive caretaker) so he will know where to put the stuff. If we limit the description to, say, 3-5 lines of relevant info then perhaps Jeff could collect the descriptions and send them out to the net maybe once a week. Something similar is done on the Mac digests that I receive. Is this a good idea? It would give us info on *all* new uploads so we don't have to depend on the occasional soul who sends his 'new uploads' message. And it would give Jeff something to do after graduation... :-)

2353. Help installing GNUEmacs V18.55!

Newsgroup: comp.sys.atari.st
Date: 1991-03-19 14:48:07 UTC
From: whitcomb@aurs01.uucp
Message-ID: <59664@aurs01.UUCP>
Source record: 233766

I recently downloaded GNUEmacs V18.55 from a local bulletin board, but have had problems installing it. I have a Mega 2, so that should be enough memory, but when I try to run it, I get an error message saying that the program was unable to load the Lisp code. I am trying to run the program using the environment variables in the Hotwire! shell.

The installation documents are really sketchy. It is possible that I am missing some files, or that my directory setup is wrong. Could someone who has this working mail me the directory map of all the files and where they are supposed to go, and the necessary environment variables?

Thanks.

Of course, the problem is that MiNT is still stuck with TOS, and TOS
does not support device drivers, so the drivers (for TOS and Minix)
are hard-coded into MiNT. I don't know a lot about the low-level mechanics
of Unix, but I think that directories are special files rather than
FAT entries, hence the different way of dealing with them (the library
emulates these directory files by caching return values from Fsfirst()/
Fsnext()). I'm sure that others here can add to this...

2357. *RELIABLE* write-through hard disk cache wanted...

Newsgroup: comp.sys.atari.st
Date: 1991-03-19 16:12:44 UTC
From: mathew@mantis.co.uk
Message-ID: <XJD3y3w163w@mantis.co.uk>
Source record: 233769

I'm looking for a hard disk cache program for my ST, to speed up things a little. I'm sure that there are hundreds of such things, so I wondered if anyone had any recommendations...

I want a write-through cache (I don't trust the things _that_ much :-) which is reliable. Ideally it should be written 'by the book'; i.e., XBRA-conformant and so on. If it has lookahead that would be an added bonus.

Replies by mail, please.

Thanks.

mathew

There are quite a few Lynx games out now. I was pleasantly surprised. I'm
almost tempted to blow some money on one... Maybe this summer...

> Lynx lost the battle, at least here in Austria. Must become smaller and
> cheaper and be there before Nintendo builds a color GameBoy.

It *has* become smaller and cheaper. The latest model of the Lynx is about
2/3 of the length, and 20% cheaper. They're also no longer forcing you to
get California Games along with the thing; I'd much rather have Gauntlet III.

I wouldn't buy a GameBoy for the same reason I won't buy a Mac.
Manufacturer's too obnoxious. I can put up with stupid companies like Atari
[ducks :-)] but deliberately monopolistic companies? No way.

I used to have Email access but not posting privileges. For the benefit of others in the same position, it's possible to post to Usenet by mailing your article to a suitable backbone site.

For example, you can post to comp.sys.atari.st by mailing your article to comp-sys-atari-st@ucbvax.berkeley.edu...

From: bayers@hub.cs.jmu.edu
Message-ID: <1991Mar19.171154.1322@hub.cs.jmu.edu>
Source record: 233799

OK, I'm sure that this has been asked many times before, but with
all of the recent revisions to GCC (1.39) and MiNT (?) I'm not
quite sure what files I need to set up a MiNT/GCC workstation.
What I'm looking to be able to do is spend as little time as possible
on our minicomputer here at JMU to do programming for UNIX multitasking.
I've heard that the MiNT libraries are relatively consistent with the
libraries on a UNIX system.

So to summarize, what files should I pull from atari.archive in order
to set up a functional MiNT/GCC workstation? If I get emailed the
solution, I will post it for everyone else.

> It can't hurt!

> Marshall

Thanks, but that problem is unlikely, if possible 8-). In any case, the
mouse and keyboard problems have now appeared in regular ST mode. I
got a new Ikbd processor from Best Electronics, but that hasn't
helped. A reset *always* fixes things for a while, so I rather doubt
that the keyboard connection is intermittent, it's hard to check!
I am now gearing up to figure out which 6850 ACIA to remove and
replace (I *did* get one from Best 8-). If I foul things up, it's a
new STE for me 8-(). At least my trial run for desoldering, replacing
the connector in my mouse, went well. I recommend the Radio Schnook
desoldering iron 8-).
A couple of interesting things came from my talks to the Best
Electronics guy. One is that the Mega keyboard is almost a drop in
fit for the original (external PS and floppies) 520ST, (same large
connector) and is only a little more expensive to buy ($110 vs $90
8-). The other interesting thing is that there are two versions of
the keyboard processor. I have an '85 ST, but luckily it used the
later processor -002. If yours is a -001 version, you need a whole new
keyboard if it goes bad (I _hope_ that version was only on the
developer 520s, this is, after all, ancient history 8-).

By the way, sorry if I have seemed unresponsive, but we lost our news
feed here for most of last week 8-(.

ciao,
Bob Pegram

In response to Mark Choi:

I think the only thing an ST notebook would need is a backlit screen and a suite of software to transfer/convert files from PC and Mac programs to ST programs and vice versa.

The essence of a portable computer is portability. Adding features like color monitor support seems extraneous. After all, how likely is it that one would carry the computer to an unoccupied (or occupied) SC1224 or SM124? A floppy is a thorny question. It's probably necessary because of market demands, but I'm sure many would do without.

Perhaps one thing to consider is a space for two Mac ROMs. And a contract with Dave Small.

Current PC notebooks are sold primarily to current computer owners. They run at $1500 up past $3000. If Atari wants to succeed, they will have to tap both the current Atari market and the PC market.

2369. Prolog summary

Newsgroup: comp.sys.atari.st
Date: 1991-03-19 21:19:27 UTC
From: SNYDERS@process.com
Message-ID: <28155@dime.cs.umass.edu>
Source record: 233785

A while ago I asked about Prolog for the ST.

The following summarizes the replies I received:

Toy Prolog:

I received an English Doc for Toy Prolog. I can send this to anyone who is interested. Or perhaps someone can upload (or tell me how to) the doc to an archive as I can not store it here for long. - Thanks to Robin Gape.

Some people have mentioned that Toy Prolog is not too good. But so far I have found it useable and it has GEM support. It is more useable than xprolog but a bit slow.

Some people have clued me in to Prolog-68 by Jens Kilian the author of Toy Prolog. Jens writes:

I recently posted a new Prolog system for the ST to comp.binaries.atari.st. It is called 'Prolog-68' and is somewhere in Volume 13 on the panarthea server. It is about 26 times faster than TOY Prolog (12 KLIPS, honestly !) and will be made as compatible as possible to the standard Prolog systems.

There are two disadvantages of the new system:
- It's not complete yet, and doesn't have TOY Prolog's GEM interface.
- The documentation isn't complete either, and it's in German again :-(
There is an English README file, but I simply don't feel like writing a book (that's what the documentation will become) in a foreign language.
You don't need to ask about new versions or more complete docs [...] I'm far away from my ST at the moment ...

I have not looked at Prolog-68 yet but I probably will.

StonyBrook Prolog: Graham Higgins writes:

I have a port of StonyBrook Prolog. It's serious (needs a few Mb of space to play in) but you're going to have to be careful about assert/retract 'cos it ain't got a garbage collector yet. Documentation is extensive. Has a byte compiler, too.

SALIX prolog: Klamer Schutte writes:

I prefered xprolog over toy prolog (10+ times faster).
But don't call not-existing predicates!

Now i use SALIX prolog. It is a commercial (approx. DM 200) package from germany. Its fast and reasonably bug resitant. The gem interface is nice (It is in prolog and no to slow).

He did not send any company contact information.

Lots of info from Singapore:

If you are serious about using prolog you should get MPROLOG. M stands for modular as they have for Mac, IBM, VAX/DEC mainframe and the file is trans- portable across all plateform. I bought the Atari version for the School for postgraduate research 2 years ago. The price at the time thet I bought are: US$3000 or $5000 for VAX/DEC, US$1000 for IBM & MAC and US$800 for Atari. I can not remember the exact price but you may write to Logicware Inc, 5915 Airport Rd. Suit 200 Toronto, Canada L4V 1T1 for their current prices. The prog ram come with 2 Disks and 1000 pages (1-3/4" Thick A4 size) Manual. We have not use the program yet as I still could not find any Postgraduate candidate to take up my AI research project yet. Reading about this program in AI magazine make me decided on MPROLOG. For cheaper and less serious work you can also run Turbo Prolog (US$99) on Atari with IBM emulator. I have tried it with PC-Ditto (slow sofware version) it is toralabled. Now I have both PC-DITTO II and Super charger with 8087 co-pro but did not have chance to retry the Turbo Prolog again. I also have ExperProlog for Mac which may work with Atari/Spectre but again have not try out yet. University of Sydney using Arity Prolog with their IBM computers and Quintus Prolog with SUN Super Micro. Arity Prolog may also work with Atari/Supercharger/PC-Speed but I do not have access to Arity Prolog myself. Hope this helps,

I have not yet contacted Logicware regarding MPROLOG.

I will post a follow up with any new information I discover.

Thanks to everyone who responded.

- John Snyders

>
>I'd agree, we should try to hide the Fsfirst/Fsnext layer completely and
>use the Unix *dir routines instead. (This seems reasonable, given MiNT's
>apparent intent to provide as much BSD functionality as possible...)

i agree with howard. only i think we should pick BSD or USG, but *not*
both. POSIX would be ideal (does it say anything about opendir/readdir/etc?
wait, i just checked... yes it does). i have to carry around ndir.h direct.h
dirent.h and all the others from BSD and USG for portability. let's stick
to posix, here, and do away with the duplicity.

posix synopsi are:

```
#include <sys/types.h>
#include <dirent.h>

DIR *opendir(dirname)
char *dirname;

struct dirent *readdir(dirp)
DIR *dirp;

void rewinddir(dirp)
DIR *dirp;

int closedir(dirp)
DIR *dirp;
```

typical use:

```
DIR *dirp;
struct dirent *d;
char *name;

if ((dirp = opendir(name)) != (DIR *) NULL)
{
while ((d = readdir(dirp)) != (struct dirent *) NULL)
do_something_with_d (d);
if (closedir(dirp))
check_errno_right_now ();
}
else
```

check_errno_right_now ();

issues: is int 32-bit or 16-bit (note that DTA uses 16-bit ints in its low-level structure)? will we support errno? zillions of (incompatible) versions (like lharc :-). note that readdir(3) provides space for the dirent so it gets wacked on subsequent calls.

i have more or less working (BSD-flavor) versions of these. it made porting BSD ls(1) easy. only trouble is it is slow as molasses for large directories. i think gulam's ls reads the FAT directly. it is great for recursive searches (i think i have a traverse(3), if memory serves). i try to hide Fsfirst/next as much as i can, though they do exist in MSDOS. not that both turbo C and MSC on the PC support the *dir functions (i think) so applications port to dos, too (if that matters). my versions use Fs*.

in general, i think sticking to posix as much as possible is what we really want. that's why it was developed, after all: portability. speed is another issue altogether. in fact, with these functions in place, it should be possible to use either GEMDOS Fs* or direct reads of the FAT and still have a portable program.

if u want, i can post these...

The reason fo rht e external montior port is that at the price premuium on pays for a notebook, it may just become your only machine. In that case, it would be a benefit to be able to (ab)use all the software that was out there, including games and other colour only software. If it had an RF composite out, that would be o.k. too, but the monitor out would be better, so a multisync could be hooked up. Look at the PC notebook market. Most of them have 1.44 meg drives, 20-40meg hard drives, a VGA port, a huge software and installed user base, and an expansion slot. The atari would seem to have: no floppy drive, a 20 meg drive, no monitor port, a very small software base and an even smaller user base. The 512k ROM space is promising though. So is the PDS.

This is the case, not only for notebooks, but for all their machines, Lately, however, they only seem to be going after that small portion of the smaller atari market that even cares about buying a new machine, so there sales fall and fall. And the possibility of carrying the notebook to a colour monitor is great if you assume that most ST owners would sell their current set up to afford the new machine. I use my TV with my Stacy all the time. (by the way, it was very agravating that the STacy does not have the STe motherboard, or RF interface. This was just pure stupidity. Especially in light of the fact that not only does in to have a battery, but the circuit board responsible for power control was scrapped as well. Lets hope they do it right this time.) I still want one, though!

Does anybody know how if there is software available for me to decode radioteletype signals from my shortwave radio with my 520 ST(soon with 1 Meg)? What else is needed to bring the signals from the radio into the computer? Any help that anyone could give would be greatly appreciated!

I have been told that Toys-R-Us sells the original package that sold for $179 at the $99 price, but not here in Austin. Every Lynx I have looked at is still priced $179, and I will not buy one at that price (even if it is a good deal at that price anyway). Maybe I could work out some deal where someone can get it at the $99 price and ship it to me and I'll pay him/her back?

From what I know , if it was the Folder Problem you will get a Warning
with the New TOS 1.4/1.6.

But there could be a Problem with the ICD Booter, if you have Write
Caching on, Try turning this Off,
This I have seen quoted to otheres by ICD, you don't have any thing to
loose by trying it..

I have ftp'ed those two files to Terminator many times, but they just seem to get lost into never-never land. I had to get them from some place in Europe, but I will try to upload those files again.

Ok, I just posted ana_m2_4.arc to atari.archive. I did not send Part 5, mostly because I erased it, partly because it was the emacs editor (3.09 I think).

Hopefully this one will get there, all other attempts at posting this file have failed, they just seemed to get lost (hmmm...).

Howdy,

I have also had a slightly similar experience. It all started when I got my Supercharger [IBM emulator, for those who don't know] a couple of months ago. I set it up and had been messing around with running different things and getting everything right and everything (other than some Supercharger problems) was going along pretty smoothly. Then, I heard the portable phone ring. I got up from the ST commanders chair and went to answer the phone. (You know that the portable phone is never where you need it.) When I found the phone, it was in it's base in the next room, and nobody was on the line. Ok, I thought, whatever. Being smart, I left the phone in the other room and went back to the trusty ST. I was using the mouse with an IBM program and about 10 minutes later the phone rang again, but I noticed that it sounded a bit strange. I answered it again and nobody was there, again.
Not long afterwards I discovered the problem, because it continued to get worse. When I would move the mouse, the phone would start it's nice shrill ringing. This became CONSTANT, whenever I would move the mouse. I thought that it was the Supercharger along w/the mouse because it had never happened before that. I guess that it could have been the mouse alone, though. Also, the fact that my 1040 now has so many cables running out of it that it resembles a mutant octopus may have contributed to the problem.

My solution is to shut the phone off. It only happens at seemingly random intervals and not that often. I think that the phone base is the key, as I have not relocated it and the phone will start whining no matter where the phone happens to be.

Well, that's my story...watch this space for more stories.

2383. Looking for good disk utilities

Newsgroup: comp.sys.atari.st
Date: 1991-03-20 02:36:14 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1991Mar20.023614.5154@rodan.acs.syr.edu>
Source record: 233780

I'm looking for a program (or a set of programs) that will do
things like, backup a hard disk, check for corrupted and
deleted files (and recover them), optimize a hard disk, move
files around on a hard disk, etc...something(s) along the
lines of Norton Utilities, SUM Utilities, PC/Mac Tools, etc
for other computers. The thing is: I'm running Spectre,
ATSpeed, and of course ST...so, I'd prefer if the backup could
backup all partitions. I also want to be able to move DOS
files around on my msdos partition, in the event something
gets screwed up there (which seems to have happened frequently
in the past, especially with disk caches for Windows 3).
Any comments (good or bad) about programs will be appreciated.

2384. ST Books & Software for sale

Newsgroup: comp.sys.atari.st
Date: 1991-03-20 03:41:30 UTC
From: jhm@snitor.UUCP
Message-ID: <jhm.669440490@nixtdc>
Source record: 233757

Due to a severe storage space-and-money shortage, I would like to sell
the items listed below.
Each purchase has a $5 postage and handling charge added (unless you
live in Toronto), and lower prices for bundles of items can be arranged.
E-mail or leave a message on my home machine (416) 604-0310. (E-mail can
be flaky for UUCP sites.)

ST Books:

Learning C Programming Graphics on the Compute!
Amiga and Atari ST M. Sugiyama & C. Metcalf $15
Atari ST Machine Language Abacus
B. Grohman, P. Seidler, & H. Sliber $15
Atari ST Tips & Tricks Abacus
R. Bruckmann, L. Englisch, J. Walkowiak, & K. Gerits $10

Pascal Texts:

Pascal A Considerate Approach (2nd Ed.)
David Price $5
Oh! Pascal! (2nd Ed.)
D. Cooper & M. Clancy $15
Introduction to Pascal Sybex
R. Zaks $15

Despite the fact that OSS (now ICD) recommends Oh! Pascal!, I found
the Zaks text much more readable. (None even touches "Illustrating
Pascal", which I'm not selling.)

ST Programming Software:

Alice The Personal Pascal (a Pascal interpreter) $35
Personal Pascal (v2.02) $30
TackleBox ST (with first two updates) $35
(TackleBox requires $10 P&H; it's that big)
Tempus (1st edition) $10
Metacomco Make (also comes with an editor) (v2.16) $10

Alice is good; I taught myself Pascal with it (and the texts
above.) I'd recommend TackleBox to anyone; it's huge and it's
accurate. Even after switching to C, I find myself referring to GEM
functions in TackleBox.

Telecommunications:

Flash 1.52, patched up to 1.60 $10
Shadow 1.1 background transfer accessory for Flash $10

Kermit & Remote Accessory for Flash(does *not* work w/Shadow)$10
Michtron's Mi-Term (supports DFT, XMODEM & ASCII) $10

Word Processing & DTP:

Microsoft Word w/GDOS fonts $5
Publishing Partner (v1.01) with LaserWriter screen fonts $20

What can I say about Publishing Partner? Not as versatile as PageStream,
but more robust. It's done yeoman work for me (three commercial manuals).

Games:

Bards Tale I with Hint Book $15
Techmate Chess game $10

2390. memory upgrade woes on a Mega 1

Newsgroup: comp.sys.atari.st
Date: 1991-03-20 11:06:58 UTC
From: wilko@idca.tds.PHILIPS.nl
Message-ID: <1236@idcapd.idca.tds.philips.nl>
Source record: 233776
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I am experiencing some problems in upgrading a Mega 1 to a Mega 2.5. I did replace bank 1 consisting of 4 x 414256 (256Kx4 chips) by 16 x 411000 (1Mx1). The missing A9 line (not used on the 414256) is connected to the 411000 via a series R of 33 ohm.

Result of all this: the ST recognizes the new bank 1 as a 128k bank, giving me a total of 640 kbytes. In addition a very interesting moving pattern of vertical bars appears on the screen. The bars are approximately 8 pixels wide. I get the impression that this screen pattern is due to non-refreshed dram locations. Apparantly the ST thinks (?) that 64 k drams are used for bank 1, resulting in a refresh cycle on 8 address lines (256 address refresh cycle) instead of the 9 address and 512 refresh cycle a 1Mbit memory cell requires.

My question: does Atari use a different MMU chip in the Mega 1 with 414256 chips which cannot handle the 1Mbit cells? This would mean I am stuck with 1Mbyte. I'd love to see Spectre running with some more memory and Multifinder.

Any help appreciated

It means that gcc hasn't enough memory to work. He says virtual memory, because gcc was first designed for UNIX, where you have virtual memory because of paging and/or swaping.

Message-ID: <1311.27f053cf@sleepy.bmd.trw.com>
Source record: 233701
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well I finally got bit last night. The wonderful STE DMA (read harddrive) bug got me. After doing a couple hours of work on the computer with probably 25 or so disk accesses it gave me the "somethings wrong with the disk drive" alert. I then could no longer see the partitions even though the hard disk driver would run. I have an ICD plus host adapter and a syquest drive.
Does this error (the STE DMA problem) always hammer the disk in the same manner? If so, what is necessary to go and recover the drive. No I didn't have a backup as I've had it only 2 weeks and wasn't sure if I liked my layout yet. (Lesson learned though :-( ).
I'll be contacting Atari about a warranty problem in the mean time.

Thanks for any help.

This solution may be a little `round the houses', but you could use the GEM2PS utility to convert the metafile to PostScript, and use dvips to convert your .DVI file. Of course, this only works if you have access to a PostScript printer... :-)

GEM2PS can be found on atari.archive (I think) and dvips can be found virtually ANYWHERE! I've not tested GEM2PS, but I use dvips every day.

2396. Problem using HP II P laserprinter with 1040 ST

Newsgroup: comp.sys.atari.st
Date: 1991-03-27 15:19:31 UTC
From: heiden@kboeng.enet.dec.com
Message-ID: <1991Mar27.150249@kboeng.enet.dec.com>
Source record: 233703

While trying to print to an HP II P laserprinter using the parallel
port I'm running into two annoying errors:
1. The printer is only recognised by the system if:
first the printer is powered on and then the
system is booted. This wouldn't be a problem,
but
2. after some time without printing anything (around
20 - 30 minutes), the system just stops running.
System needs a reboot to come into live again.
Does anybody made similar experience and found solutions to
these problems ? My setup is:
1040 ST with 2.5 Mbyte , TOS 1.4, Neodesk 3.0,
SH204 and SM124

Any help is appreciated. Matthias Heiden

Well, obviously you will want this system to be able to multi-task.
Instead of writing the code yourself, you might think about using
Eric Smith's MiNT, which adds BSD-type extensions to TOS. You can
re-compile XLISP with GCC and ES's MiNT library to use MiNT by default.
MiNT will make it easier to put BIOS i/o into windows, manage multiple
threads of the same program, etc. etc.

BTW, to try out your ideas, try using XLISP under MGR. MGR is a
windowing system where all graphics, window management etc. is done
with escape sequences, and it runs on the ST under MiNT (ie. you draw
circles, open and resize windows, pass messages, etc., the same way
that you turn inverse video on and off on the vt52!!). You could write
all of the MGR code IN XLISP first (just print the appropriate escape
sequences to the screen), and then hard-code it into C if you want to.
The advantages of using MGR are that you can concentrate on the high-
level logic of your project instead of the nitty-gritty details of getting
BIOS output into GEM windows, etc. Also, your XLISP code will be portable
to Unix or Mac machines running MGR (Minix may soon have MGR too), so
you are looking at a much larger potential user base.

It sounds like an excellent idea, and I hope that it works out for you.
You will need at least 2 megs to use MiNT and MGR, I should add.

2398. Mega's in Canada?

Newsgroup: comp.sys.atari.st
Date: 1991-03-27 15:49:22 UTC
From: david10@garfield.cs.mun.ca
Message-ID: <1991Mar27.154922.11262@garfield.cs.mun.ca>
Source record: 233705

After looking at my local dealer's price list from January, I noticed that the only model listed in the Mega line was the Mega 4 STE (which, at $2495 CAN, is a bit out of my price range :^{( ). Are the Mega 1 STE and (preferably) the Mega 2 STE available up here in the Great White North? If so, where are they sold and for how much?

Thanks in advance,
Dave C

>to find any information on how to find it. Could someone please send
>a short reply telling me where atari.archive is and what I need to do
>in order to use it? I would really appreciate it. Thanks.
>
>Kevin Garrick
>garrick@greyrock.mso.colostate.edu

The complete address for atari.archive is atari.archive.umich.edu
and all you have to do is:

ftp atari.archive.umich.edu <ret>

and when the connected... answer arrives and the "your name: (garrick)"
follows, type in "anonymous" <ret>, and then it asks your password,
type in "garrick@greyrock.mso.colostate.edu".
Then "guest login OK, restrictions appear" appears, and the prompt
"ftp>" follows.
You are in now.
This is called "anonymous FTP", (FTP = File Transfer Protocol), and it is
widely used for up- and downloading PD, SW and FW -> free stuff.

The basic ftp commands you need are:
cd changes the directory like in MS-DOS or Unix
dir or ls lists the contents of the directory, wildcards can be used
bin sets the transmission to binary mode, use for packed files and
executable programs and other non-ascii files.
asc sets the transmission to ascii mode, default
get transfers the file given after this command to you
put transfers your file to the remote-end
mget like get, but takes many, wildcards can be used
mput like put, ...
quit you know...

You can get help about the rest of the commands by typing "?" or "help" in
ftp.

In atari.archive there is a file in the /atari/ -directory called Index,
that holds the names and descriptions of the files available.

It may well be completed now, few days ago there was still some work to do.

ftp is a quite good tool, just find out about it. Try to find a manual or
something about it, it is worth it!

This sounds pretty nifty, but will the machine also allow a
normal keyboard to be plugged in? The HCR interface would be very
handy for portable use, but I can type a lot faster than I can write,
and it would be nice to have the option available.

Help! How can I connect a Zenith Data Systems ZVM-135 RGB Monitor to an
Atari 1040STE? Here's the ZVM-135's connector pinout:

1 - Negative horizontal or negative composite sync*
2 - Positive horizontal or positive composite sync*
3 - NC
4 - Positive vertical or positive composite sync
5 - Green input
6 - Blue input
7 - Red input
8 - NC
9 - NC
10 - Green feedthrough
11 - Apple X1 Input
12 - Apple X2 Input
13 - Apple X3 Input
14 - Negative vertical or negative composite sync
15 - IBM intensity
16 - Ground
17 - NC
18 - Audio input
19 - Ground
20 - Composite video input
21 - Red feedthrough
22 - Blue feedthrough
23 - NC
24 - NC
25 - Apple X8 input

*NOTE: Composite sync must be supplied to both the horizontal and vertical
sync inputs.

Specifications:

inputs ..... DB-25 type connector
R,G, and B signals TTL level analog positive
Composite - TTL positive or negative
Horiz sync - TTL positive or negative
Vert sync - TTL positive or negative
Ground
Audio - .5V to 1V rms.
Audio ground.
Apple III video - (4)
IBM intensity

Composite video.

This monitor is switchable from RGB to Composite. It has an DB-25 RGB connector and a set of RCA phono type jacks for composite. There was a message floating around (dated 4 Jan 87) that showed how to connect a Sony XBR monitor to an ST and it works (I've seen the result). I realize that I could just use the composite input with the STE but I would like to use the RGB for obvious reasons. Anybody got any clues????

here is a program out there that at random intervals, and whenever there is a disk access, does the following:
you hear a very faint police siren that gradually gets louder and louder. When it reaches max volume, a little police car drives across your screen, the pitch changes as the car flies past, and then diminishes in volume. The humour of the thing quickly dies, as the interval is set to a much to frequent setting, but it is fun to put in someones bootdisk, and screw with there head for a day or so. The first time it happens, boy do their eyes bug out. The pink Energizer bunny (from a previous post) would be about the same thing. Someone should do it.

Source record: 233713

personally, I hate DEGAS with a passion. I thionk the user interface sucks the big red wazoo, and although the feature that it has are nice, it is missing some things which really are necesary, such as bezier curves. But I will sell you mine if you want it!(to each his own) If so, make me an offer.

-geisha-
just to be helpful, there is a pd/shareware, I'm not sure which, as it doesn't say in the info box, and I got no text files with it, but it's too good to be free(!) called DT paint. It is a monochrome desk accessory with pipes to other applications. It has just about everything, including editable bezier curves, and as a desk accessory, it is boucoup handy. It ready many formats, but is primarily a IMG editor. It can edit files at any rs., up to 300dpi even. Needless to say, it can work with documents bigger than the screen. It has it's own menu bar, even though it is a DA!, and a cool tool palette that is small but very functional, the best combination. The version that I have only works in mono though.
Also, avoid canvas. It bites. Well for something programmed by a 15 year old in his spare time, it's way cool, but as a real productivity package, it just does not cut it. It blows the socks off DEGAS, though, with sorta 4096 colours on screen, and animation and pseudo 3D capabilities.
Try the new stuff from LEXICOR if you have the money, they look very good.

2407. Re: TT & GCR 3.0 ???

> Is there anybody out there with a TT & spectre GCR 3.0 (the newest ??)

Er, no but I do have GCR 3 and a Mega4. TT's just aren't here (US) yet.

> - Does it really work ?? How? ... any problems with mac software/peripherals

In the Gadget's newsletter, Dave claims it works just great on the TT. As for version 3 of the software, it works wonderfully!! All the major programs work without a hitch.

> - what kind of a floppy drive format does 3.0 use...

Standard Mac 800K (HFS) and 400K (MFS) disks. However, Gadget's have gotten the Mac to think it has one of the new SWIM disk controller chips in it. On the Mac, it allows you to use 1.44 floppys and read Ms-dos disks. So this means that you can easily copy files from ST to Mac with programs such as Apple File Exchange or DosMounter.

> - how about TT's hard disk (scsi) does it work on TT&dma hard disk ??

Not quite sure what you're asking here...

> - what about my old st1040f with tos 1.1 or 1.2 or something like that ???

Yup, works fine. Although I'd recommend you get at least 2 megs of software and a hard drive to do anything decent.

> - can it (gcr) use the mac type lan in TT ???

The next update of the software will work with the LocalTalk TT port.

> is it worth buying ??

Oh YEAH! Works great, great support and....it's worth the money.
If you have anymore questions, just ask!

>This is too bad. (4)

> ....I write this in the hope that enough (5)
>external pressure will force a redesign.

Hopefully, if I post this I won't have to repeat it too often:

1) I didn't include a monitor port for a couple of reasons:
A) Power
The graphics shifter/video drive circuitry uses almost as much
power as the rest of the system put together. Since the machine
is specifically designed for PORTABLE usage, I made the (fairly
reasonable) assumption that you aren't going to carry a color/mono
monitor around with you.
B) Space
Hey, I tossed out ANYTHING I didn't feel was required in a PORTABLE
machine, to make the machine as small as possible.

2) If you look at the so-called competition (Intel-based machines) I think
you will find that the "note-book" sized units include EITHER a floppy
or a hard disk, but not both. Since this machine was mosty intended to
allow desktop-ATARI users to take specific data/applications with them
on the road, I felt that loading data/programs into the internal Hard
Drive would not be a hardship. Would you rather carry a hard-drive
machine, or a floppy machine with a bunch of floppies that you have to
swap in-and-out?
As far as data transfer, both the Notebook and Pad versions of the
machines will include file-transfer software in the ROMS, transfering
over parallel-ports to other ST's, and serial ports to non-ATARI
machines (hopefuly with an existing protocol, so Atari won't have to

write [shudder!!] MS-DOS software).

3) Look for high-density floppies, both in desktop machines and in an external (probably battery-operated) floppy drive for the ST notebook (or whatever its final name is). We may be slow, but we ain't Blind/Dumb.

4) Both the STPad and STBook have an "expansion" port that includes all address and data lines, bus control lines, R/W and a number of ROM select lines. ALL of the signals needed for the "cartridge port" are present on "expansion port", so a conversion device need only consist of two connectors, a PC-board, and a housing. I'm sure some enterprising developer will make such available at a reasonable price. Even better, maybe "cartridges" will be upgraded to take advantage of new features.

5) Maybe we should take a vote: Should we let everybody add their 2 cents to the design, increase the size of the machine, delay it a few months/ years, increase the price, etc? :) :) :) :) :) 8) 8) 8) 8^) 8^) 8^)

Oh, incidently, in the reprint from Tom Harker (ICD) he mentions that the note-book machine has JEIDA cards. He was a little confused; The note-book machine has the hard-drive as storage, the PAD machine has JEIDA cards, but NO hard-drive (the pad is intended to be hand-held; one twist and BOOM! the hard-drive would crash).

TRH

[PLEEEEAAAASSSEE note the smileys above! don't send me votes/suggestions/etc; it's hard ENOUGH to get through my mail/news each morning.]

From: stevendd@sage.cc.purdue.edu
Message-ID: <8889@mentor.cc.purdue.edu>
Source record: 233720

I finally desided to upgrade my single sided drive, I just got the new drive today. I thought all I had to was swap drives. The plug from the small board in the drive case isn't the same as the one one the drive. The connector on the board is for 14 pins, the drive connector is 34 pins. I rember reading some of the early single sided drives used an old kind of connector (guess what kind I got). If you know how to convert the plugs I would be very appreciative.

Thanks.

>Does anybody have any strong recommendations and/or avoidables
>they'd like to share? Email preferred - I'll summarize.

I can recommend GCC Technologies' BLP II and BLP IIS. For $1999 list
the BLP II is a 4 ppm printer, with 2 Mb RAM expandable to 4 Mb by plugging
in off-the-shelf SIMMs. It also has a SCSI port for attaching a hard drive
for font downloading and precomputing. The BLP IIS, for $2899, is an 8 ppm
printer with the same features. Both printers are based on an LED engine,
so instead of a laser beam with lenses and a rotating mirror they've got a
row of LED's drawing staight onto the drum. Very nice, clean design, and
the output quality is excellent.

The only drawback is that the printers come standard with only a LocalTalk
interface, so you would either need to add LocalTalk to your PC and ST
(PromiseLAN, anyone?) or add the serial and parallel interface option to the
printer ($100 or so). You can contact GCC Technologies at 800/422-7777.

My 0.02 worth. I looked into this last year. The ST versions are not very
nice, at least compared with MAC and MS/DOS.

The Best for the buck is PAF from the Mormons. MAC and MS/Dos for $39 each.

Mac ones run well on Spectre 128.

Ms/Dos ones run adequately on PC-Ditto (software emulator), and very well
on the hardware emulators.

2417. deskjet 500/wordplus

Newsgroup: comp.sys.atari.st
Date: 1991-03-27 23:05:07 UTC
From: ix@cosmo.UUCP
Message-ID: <6645@balu.UUCP>
Source record: 233723

Hi everyone,
i need a printer driver for the combination wordplus/hp deskjet 500
and a graphic hardcopy program.
I would be grateful, if somebody would send it to me by e mail:

js%ulf@cosmo.uucp

Thanks!
Juergen Seeger

The Atari monitor connector has a line for composite video. This is essentially
regular NTSC signal without being modulated to a TV frequency. You can buy or
build a cable that will go from the monitor port to a composite connector
(usually a regular RCA jack) Some TV/monitors can use a composite signal
directly. For TVs that can't, a composite -> channel 3/4 modulator should be
obtainable at the local Radio Shack.

Hope this helps.
```

I realize that the LAN and Serial 2 are run by the same _chip_, but what about physical ports themselves:

If you have a VME card, you lose the Serial1 and Serial 2 connectors: But does that also mean that you lose the LAN connector as well? Or are you just refering to the connector with all the modem signals (except RI)? If you lose the LAN too, that would be a silly thing to do: you can either hook yourself into a network OR you can use <insert hardware extra like RAM, etc.>, but you can't use both. You shouldn't have to make that kind of a choice!

----------------------------------------

Atari ST520 with 4M RAM, 16Mhz accelerator, 20MB **HARDDISK**
*TWO* 720K floppies, monitor , modem, PRINTER etc
PLUS LASER C with Debugger, LWD Basic, Assembler,, Wordprocessors,
spreadsheet, PC-Ditto, Games and lots of other software....

Hardware & Software. All goes as a package ..
only $700 or best offer.
Excellent Condition; Working Like New!

HARDWARE:
--------
4 megabyte RAM; 16 MHZ accelerator chip; mouse, external
20 megabyte hard disk; two 3.5"/720 kilobyte floppy drives;
color monitor; Avatex 1200 bauds external modem; real time
clock; internal fans for cooling; power supplies and floppy
drives enclosed in heavy-duty metal case; MIDI port; serial port;
parallel port; communications port; TV set port; Morrow MP100 daisy
wheel parallel printer (with a box of ribbons); Jacobson Anderson
serial printer/terminal/typewriter; 50 cps, dot- matrix Texas
Instruments 8 pin printer, all interconnection cables included.

SOFTWARE LANGUAGES:
------------------
68000 Assempro Assembly; Laser C Compiler/Linker; Laser C Debugger;
LDW Basic Compiler/Linker; ST Basic Interpreter; ST Logo.

SOFTWARE UTILITIES:
------------------
Revolver memory manager; Universal item selector II directory/file
manager; Turbo ST accelerator; Z-time real time calendar/clock
manager; Aerco EasieST utilities; PC ditto for MS-DOS applications
compatibility.

SOFTWARE APPLICATIONS:
---------------------
Flash communications package; Wordplus wordprocessor; Wordplus
merge mailer; Wordplus dictionary merger; VIP Professional
1-2-3- like spreadsheet; HelpCALC spreadsheet templates for
VIP Professional; dbMan database manager; Hippoconcept idea
processor/outliner; Express letter processor; Easydraw draw
package; Macromouse automatic-mouse programmer; STkey keyboard
```

programmer; Learning C graphics; stereo CAD-3D CAD package;
Cybermate CAD package; Lionhart PERT scheduler; Lionhart Planner 1;
Lionhart Planner 2; ST GEM operation system programming.

EDUCATION:

Learning Trigonometry; Typing Tutor; The Cartographer Maps.

GAMES:

Joust; Megaroids; Frozen Legacy; Sundog; Flight Simulator II;
Hippo Almanac; Super Huey; Hippo Jokes; Neochrome.

>[...]

I agree that you can probably type a paragraph of prose faster than you can write it out by hand. But what about a mathematical proof or the solution to a physics problem with all its special symbols? I also move the cursor up and down a lot when I type, and that takes quite a bit of time, relatively speaking. I think in some circumstances, I would be more productive if I could use a pen instead of a keyboard. I think I can type a paragraph faster than I can write it, but I think I could write a page faster than I could type it.

This also happens with the HP Deskjet series of printers. For some reason, the Atari parallel port interface chip will lock the printer strobe bit down (or was it the busy bit?) if it is pulled low for any lenght of time (fractions of a second.)

The HP printer is a very heavy load until it is powered up. Once the Atari bit flips, even if the load is removed, it stays flipped.

There is a software program around that will go in and toggel the bit and get things running again. There are also parallel port buffer drivers available. But I opted for a one transistor in the printer cable solution.

Included here is a repost of my solution to this age old problem :-)

****** repost *****

HP DeskJet Plus / Atari ST power-up sequence problem -- solved!

I have discovered that if the Atari ST parallel (printer) port STROBE line (normally high) is pulled toward ground (low) by a heavy load (such as a powered-off HP DeskJet Plus), the ST STROBE line will thereafter stay low until the load is removed (by powering up the DJ+), and until software intentionally sets the STROBE line high again. (Weird note: the STROBE line has to be pulled low for something on the order of 1/2 second or longer for it to "stick" low -- I do not know why this is.)

Once the STROBE line gets stuck low, the DJ+ responds with a BUSY set high. The Atari TOS will not send any data to the printer while the BUSY line is high -- so no printing can take place.

There are six solutions to this grid-lock (I recommend #6):

1.) Power up the DJ+ first and the ST second. (Then the ST will never see a heavy "low" load on the STROBE line.)

2.) Push the Atari RESET button. (The reset sequence sets the STROBE line high, clearing the problem.)

3.) Have a software routine which sets the STROBE line high. (No sense putting this in the auto folder to clear it on reboot, since reboot itself clears the problem -- until next time.)

4.) Power cycle the DJ+ with a print job in the ST "queue". (You will lose the first part of the print job, and I think the print job must be a minimum length of bytes long to get it over the DJ+ power-up self-test delay.)

5.) Momentarily ground the BUSY line with a print job in the ST "queue". (I'm not sure if you will lose the first byte of your listing with this method.)

6.) Install a PNP transistor in the STROBE line. This fix is much simpler than it may seem. Also it simultaneously solves the heavy loading problem the DJ+ puts on the Atari STROBE line. (Without the transistor, the loading on the STROBE line appears to push it near the 0.8 volt level limit. The DATA lines do not seem to have same problem, their low levels seem to be well within limits -- so no buffering seems needed.)

You need:

- One 2N2907 (or practically any PNP transistor)

- Access to the Printer cable wires for pin #1 (STROBE) and any ground pin (pins 18-25 on the Atari end, or pins 19-30 on the DJ+ end.) I managed to do this inside the cover of the Centronics-type connector.

Step #1 Disconnect the STROBE wire from pin #1.

Step #2 Connect the Emitter (E) wire of the transistor to the Printer side of the wire/pin#1 split you did in step #1. (It depends upon which end of the cable you put your transistor into.)

Step #3 Connect the Base (B) of the transistor to the Atari side of the wire/pin#1 split you did in step #1.

Step #4 Connect the Collector (C) of the transistor to one of the ground pins (18-25 Atari end, or 19-30 DJ+ end.)
[Caution: Metal cased transistors often have the case electrically connected to the Collector -- hence the case will most likely be grounded -- avoid having the case touch anything that should not be grounded.]

Step #5 Close up and/or wrap up. Make sure the transistor case and connections are not touching anything they shouldn't be touching.

Figures:

-----> Ground

! E / pin configuration -- bottom view.
----
```

Appendix:

Speed on the parallel printer port.

The Atari does screen dumps at about 1250 bytes/second.

The Atari does text dumps at about 714 bytes/second.

A GFA Basic program I wrote dumps graphic bytes to the DJ+ at
about 2174 bytes/second. Since an 8 by 8 inch graphic picture
with 300dpi density requires 720,000 bytes -- you can see that the
dump alone should take almost 6 minutes for even the GFA program.

This all suggests that one might want to take advantage of the
DJ+'s mixed mode graphic commands, where "blank" space is jumped
over. Software should be able to "count" over these locations
much faster than it would take to dump them in dumb mode.

THE END.

2427. Could this be the phantom typist?

Newsgroup: comp.sys.atari.st
Date: 1991-03-28 05:26:21 UTC
From: logajan@ns.network.com
Message-ID: <1991Mar28.052621.18307@ns.network.com>
Source record: 233733

Okay, I admit not paying attention the last ten times this was discussed,
but:

If I disable interrupts (set SR to $2700) but don't shut down the
keyboard ACIA (don't send $13 to $fffc02) then I can get the ACIA
into a weird state if I hit a key on the keyboard while the interrupts
are still off.

Whatever was the first key pressed in this state will continue to
be presented from the ACIA after interrupts are turned on again
(set SR to $2300).

The ACIA seemingly spits out that "stuck" character every half second
or so, and will continue to do so until another key on the keyboard
is hit.

The other way I have found to "kill the phantom" is to send the reset
command to the ACIA ($3 to $fffc00 then $96 to $fffc00) just before
I turn interrupts back on.

Could this be the phantom typist?

Awesome. So, cartridge-type expansion port that actually allows R/W
access, eh? Great, it's about time. Um, if *all* the address lines are
present, does this mean the CPU is now allowed to address its full 16MB
address space? Or does the GLUE still bus-error on writes outside the 4MB
limit?

Geeze, I guess I'm missing something by not getting onto GEnie...

Propsero Pascal gives similar problem. I rather use 'close file' option from
the file menu. I've notified Prospero about the matter quite long ago and they
have not solved it in their latter versions.

Well I did have a few problems with Squish and DC Plus.
I could not Squish Magic Formater, a DC PD program, mind you this is
the only program that has caused a problem so far.

Get a few problems with DC Plus, you can't set the Base Directory,
of the files that you wish to ARC/LZH from,
and if more than 2 pages of Extracted data, you get some funny things
going on, like click on a File, and a another file comes up in its place,
try to click on a Folder to open the files in it, no go,

Will not let you have more than 2 folders deep, in a LZH File, is this
the LZH Limit ?, unabel to save default paths, path is set from where
the Program is run from

But still they are Very good progams..

One thing that I like about DC, is they don't just keep updating there
stuff every week or days, with some otheres its out of date as soon as you
get it ???

Well this has happened to me, was helping a friend that has just got
a STE, and was using my Drive connected to a Mega File 30, had
problems with this, the Mega File 30 would not connect to me Drive with
a Supra Host adapter
It had to be Atati to Mega File 30, then my Drive, this I can't understand..

Well after the 3rd STE, all different faults, The Directories of the
Mega File and mine where damaged, This was caused by the last but one
STE , we now have a STE that works..!!

With a use of a program, was able to Fix the Mega File 30.

But the big problem is that the data in the Directory of my 'C', Partition
are moved 2 bytes to the left, a total of say 6 sectors.

Is there a Util that can move the Data back , all the sector editors
that I have tried just over type, there is no insert mode !!

I don't realy want to retype over 3000 bytes..

Can some one Help !!

In article <8217@crash.cts.com> chuckie@pro-odyssey.cts.com (Chuck Schul) writes:
>what the hell is that game about???????

Sundog is my all time favorite game for the ST. It is an early effort from FTL (their first?), the folks that brought you Dungeon Master and Oids.

As the game starts, you have been released from indentured service in the Mines, being told that you have inherited a space ship from a distant uncle, who you've never heard of. Unfortunately, you have also inherited his contract to build a city on a distant planet. If you want the ship, you have to complete the contract.

You start out on the planet where the new city will be, and your first task is to find the city's site. Upon finding it, you will be given a list of materials that you need to bring from other cities, including Cyrogens...frozen workers who will build the city. In early levels you can find most of what you need on your base planet, but as the game progresses, you have to explore other worlds in other solar systems.

The game has lots of elements. You have to keep your ship properly outfitted with components. These components often get damaged as Pirates try to steal your cargo in interplanetary travel. Locally, various cities offer specialized goods, such as hand weapons (which you need to ward off muggers), "custom" components for your ship, illegal drugs (which you can experiment with or sell for profit... or ignore completely) and so on.

There are lots of ways to play the game, but I don't want to give too much away. You must be a savvy negotiator to get good prices on contraband, a good businessman to get the proper supplies for your city and still make a profit, a good navigator to judge when the best times to visit other star systems, a good fighter to survive your bouts with the pirates, and a lucky SOB to survive to win!

All of the worlds have their own personalities, and half the fun is exploring them.

Considering that you can find this game CHEAP these days, you should really check it out...and resist the temptation of reading the cheat files that are around (they not only defeat the purpose of the game, but are also just WRONG about several things). The fun in this game is not just in winning it, but experiencing the extremely detailed universe that has been created for you.

>escape sequence. I have tried to see if the macros would take a undo, but
>it does not seem to work. Anyone have any ideas how I can get to this
>character? I have tried just about every control combination.
>
>swood
>

Now if you are using a DecServer to acess your systems, then do the
following at the local> prompt:

1) Define port local switch whatever_key_stroke_you_want

i.e. define port local switch ^_ (this is control-underscore)

the define makes it permanent for the port but it is not active until
you relog in to that port so....

2) set port local switch whatever_key_stroke_you_want

i.e. set port local switch ^_

now, do the define first or every time you do that "magic" key
combination, you will be brought out to the local> prompt...

Have fun....

P.S. I typically run 4 different sessions and I just pop back and
forth..

This is an item I feel is not worth talking about as well. The machine is
portable, so who cares if it hooks up to a monitor or not. I think the
original poster wants a machine to replace his current machine, so he can
have a "double-duty" machine, not two separate ones.

> 2) If you look at the so-called competition (Intel machines) I think

> write [shudder!!] MS-DOS software).

This is where I think you are wrong. The Panasonic CF-170 (or Tandy 1500HD,
same machine) has both a 20 meg hard drives and a 1.44meg disk drive built-in
to a really nice notebook machine. The hard drive is a nice 2.5" Conner
CP-2024 and is really fast (14ms). It also has room for a 2400baud modem
internally, and after looking inside, I found that they could have added more
if they wanted to.

> 3) Look for high-density floppies, both in desktop machines and in an
> external (probably battery-operated) floppy drive for the ST notebook
> (or whatever its final name is). We may be slow, but we ain't

> Blind/Dumb.

I don't know why you guys can't just go totally with 1.44meg drives. Gee, a high density controller for the PC can be had for $30, so the parts can't be that expensive.

> 4) Both the STPad and STBook have an "expansion" port that includes all
> address and data lines, bus control lines, R/W and a number of ROM

> enterprising developer will make such available at a reasonable price.
> Even better, maybe "cartridges" will be upgraded to take advantage of
> new features.

While I feel its nice that the machine does have expansion, I dread the idea of another interface thingy hanging off the machine. With my ST, I had a machine around 3 feet wide counting all the crap hanging off the ends.

> 5) Maybe we should take a vote: Should we let everybody add their 2 cents
> to the design, increase the size of the machine, delay it a few months/
> years, increase the price, etc? :) :) :) :) :) 8) 8) 8) 8^) 8^) 8^)

Before making machines, maybe you should...

(1) Ask some people what they want.
(2) Check out the competitors machines.
(3) Think.

I know doing these might add some time to the process, but other people seem to do it and come out with machines in a decent time-frame.

> Oh, incidently, in the reprint from Tom Harker (ICD) he mentions that
>the note-book machine has JEIDA cards. He was a little confused; The note-book
>machine has the hard-drive as storage, the PAD machine has JEIDA cards, but NO
>hard-drive (the pad is intended to be hand-held; one twist and BOOM! the
>hard-drive would crash).

While it would be nice if the laptop had the JEIDA card socket, I really don't think it would be necessary. Anyway, how expensive is it to add one of those sockets to the machine. The whole PC card setup only costs $79.95, so it can't really cost that much.

> TRH
>
>[PLEEEEAAAASSSEE note the smileys above! don't send me votes/suggestions/etc;

I use "Copy II ST" from Central Point Software, Inc., 9700 SW Capitol Hwy. #100, Portland, OR 97219, telephone (503) 244-5782. I don't use it a lot, but it has worked for the few games I have that had protected disks. I don't know if they've come out with new versions for Mega STs or TTs.

Hello -

I'm wondering if anyone could give me some information on
Atari ST AES/VDI calls. I am using the Sozobon C development system
and I have the bindings for these calls, but I can't seem to find
anything on what the calls actually are! Everything I read seems to
assume that I own a copy of the ST Development Toolkit, which I don't.

Does anyone know of any documentation I might be able to find
online which would explain how to use these calls?

- Thanks

Andy Dickinson

There is a commercial version of this from Interstel that is really quite good and allows up to 3 players (2 can be either human or computer) and has a very nice user interface.

Well I have SMPTE-TRACK II (EDITTRACK II with SMPTE) and a friend of mine has
Tiger Cub. I think these are both very good packages but the Hybrid Arts
package can definetly do a LOT more that Tiger Cub. I suspect both of them will
do what you want (Not sure what you mean by "Song" editing). It certainly does
the rest.

I thought this only happened when you were using it on an accessory or
auto folder program that was currently in use and TOS denied access to.
Seems to me that if there were a way around this that they certainly
would have found it, maybe not. I've seen people try to rename the files
and delete them, but that doesn't help. Just reboot without that .ACC or
.PRG, do your stuff, then boot with it again. If its not accessories or
auto folder programs you are talking about then you should be using
PFXPAK, it will give you better compression (I haven't been able to
compare the latest DC-Squish's compression to PFXPAK, in fact, I'm not
sure what version I did the comparison with, maybe 1.0. I can find out
if its important).... Glad to read some comments on the new DC-Utils, I
was gonna buy it at the San Antonio dealer a couple weeks ago, but they
were out. Anyway...

The preceding opinions are my own and not those of anyone else who

>

Buggy? And I suppose you think that GEM on the ST is beautiful, bug-free, and ultra efficient. Crash-prone? I've been using Windows 3.0 since it was released, and it hasn't crashed yet. Requires a 20MHz 386 to be tolerably fast? Bullsh*t. Ugly? Well, that's a matter of opinion, and IMHO GEM is the ugliest GUI of the bunch.

As far as the OS is concerned, you shouldn't feel this need to bash on MS-DOS. After all, TOS and DOS are practically the same OS, ported to different machines. Just look at the major system calls for both OSes -- exactly the same.

From: mspacek@fquest.fidonet.org
Message-ID: <eBHJZ2w162w@fquest.fidonet.org>
Source record: 233556

I bought a used JRI RAM+ SIMM memory upgrade board (type C) for my 1040STf and 2 1-meg SIMMs. I bought it used from a local guy. Anyway, the disk that came with it had gotten trashed somewhere along the line. He is gonna try and get another one for me. In the meantime, I was wondering if anyone out there could at least tell me what programs come on the disk, and perhaps even UUEncode it and mail it to me. I'm not sure if its technically legal to do that. I can't tell without looking at the disk to see what restrictions are spelled out. I doubt that anyone should really care though. What possible use could anyone that didn't own a JRI board get out of it, and who would it hurt? Anyway, any help in E-Mail would be appreciated...

The preceding opinions are my own and not those of anyone else who might be registered on fquest.fidonet.org. All flames can be sent to alt.flames since we don't read that here.

This is just not true. I have looked at the intel based notebooks, and
they do usually have both. Oh well. I just disagree with the design
concept here. To get ten hours of battery life by tossing out everything
including the kitchen sink, is not "innovative power management" or
however it was refered to in the news release.
> Excerpts from netnews.comp.sys.atari.st: 27-Mar-91 Re: Two New Computer

> Blind/Dumb.

Does this mean that the notebook floopy controller *WILL* support 1.44
meg drives? Also, if you are lookinig at a battery powered floppy, and
batterylife was the problem with putting a floppy in the notebook, why
not just add more batteries to the notebook? As for the last statement
Atari employees like yourself seem to be terrific. But Atari the
company. It *is* Blind/Dumb! And excruciatingly slow as well.
> Excerpts from netnews.comp.sys.atari.st: 27-Mar-91 Re: Two New Computer
> Announ.. T R Hall@atari.UUCP (3687)

> Even better, maybe "cartridges" will be upgraded to take advantage of
> new features.

This, however, is great news, and cool as hell. I bet GBS *will*
redesign the board, if the price point for the notebook is right. If so,
and the Atari notebook (STacey feminine, my suggested name) will seel
well as the first truely poratable mac, as well as a good PC, and Atari

as well. Maybe then people would get interested ion software for native modes, as well as software for their emulations, and the software market for the ST would take off.

> Excerpts from netnews.comp.sys.atari.st: 27-Mar-91 Re: Two New Computer

> Maybe we should take a vote: Should we let everybody add their 2 cents
> to the design, increase the size of the machine, delay it a few months/
> years, increase the price, etc? :) :) :) :) :) 8) 8) 8) 8^) 8^) 8^)

No, just listen to the market out there, and do what is necessary to sell to that market. If the machine needs a redesign to sell, then it does. If not, then... . I do not think that targeting it soley at the current Atari community is wise. We are small, getting smaller, and the number of ST people who will buy the notebook is even smaller. Granted we may all want to, but most bought the ST for price, and we are not monied enough to buy every new machine that comes out. Look at TT sales. If it takes a few months delay to allow you to sell 5 times the number of machines, it is worth it. If it took Atari years to add a floopy drive, something is wrong. Also, if you keep smiling that much, your jaw will fall off :^|.

Lastly, as far as monitor support, you mention, as do others the carrying around of monitors is not likely. You miss the point. In the PC world, the VGA port is used to dock the machine to a desk setup, where the advantages of a desk setup, and its wall power, etc., and the advantages of CRT over LCD are most appreciated. I would not carry a monitor with me, but I would like to plug in a monitor at home. Also, If no monitor circuitry if provided, an RF circuit would do, adn draw less power. If power was the concern, then it could be made in such a way that the monitor circuitry operated off a seperate (external) power supply, and so that restriction is bypassed. Or a greyscale LCD could have been used for colour modes. In a world of VGA PC's EGA doesn't make it very well. Hopefully either an expansion board, or the Lexicor board will allow external monitor support.

Only my $.04 worth, but I think it is important.

[specs deleted]

Whether this will work depends on what sync rates it is capable of supporting;
it certainly has the right connections. Judging by the model number (135) and
supported modes, it almost sounds like the Philips/Magnavoc CM135 which is now
being sold by Atari (minus the composite and digital RGB options) as the
SC1435...

> 1040 ST with 2.5 Mbyte , TOS 1.4, Neodesk 3.0,
> SH204 and SM124

Hmmmmmm. I have a similar setup and have not experienced any of the symptoms
you describe. I can turn on the printer at any time, and it can sit around for
hours on end with no trouble. My setup:

520ST, TOS 1.4 (was 1.0 for awhile), 2 meg, 2 DS/DD, 65 Meg HD, Mono + Color,
Neodesk 3.0, HP LJ IIP w/2.5 Meg

Your first problem sounds similar to problems reported by people using the
HP DeskJet printer. There are several PD fixes available for this problem.
Ask around.

Your pal,
Mike Goo

Online? Not much. The Tim Oren ``Pro GEM'' series should be available
at atari.archive.umich.edu; it's a GEM programming tutorial. You also
should make a point of grabbing all the GEM C code you can find.

(This is a good point at which to insert another appeal for authors
of PD programs to publish their source code.)

Books to look for include the Abacus ``Atari ST GEM Programmer's
Reference'' and Bantam's ``Atari ST Application Programming'' (which is
out of print).

Try your college library and don't forget about interlibrary loans.

Using the Bantam book as a guide, I wrote a set of AES bindings a couple
of years ago and fully intended to complete the job with VDI bindings and
documentation, but set the project aside when Ian Lepore's GEMfast
libraries appeared. Maybe I should have done the docs anyway.

Source record: 233566

Hi Neil,
Actually several of the items you mentioned actually do exist.
Namely the PS3000 (I bought two, and yes... one of them looks great on top of
my Mega ST4), Mega ST1 and the 4160STe.
The PS3000 is a JVC-built SC1224 (yes... a color monitor) with a
built-in SSDD floppy drive.
The Mega ST1 I had limited availability in parts of Europe (Germany I
think, someone correct me if not).
The 4160STe does exist (I set some up at the NAMM show); although it
is just a 1040STe with 4m of SIMM's added. It cheaper for Atari, the dealers
and the users to just let the dealers and users to upgrade a 1040STe to 4m.
Bye.............

You asked for it, you get it: I'd like to have an external mouse port
for the ST Notebook. At CeBIT, I was told that there would be none.
I don't vote for a mouse bundled with the notebook; I've been told
that mice are real power-hungry. But there should at least be the option.
The reason I ask for this is that most people that were allowed to
have a little hands-on practice with the ST Notebook didn't like the
mouse replacement gadget very much (well, at least most of the people
I talked to at CeBIT, including many developpers).

I think you've done a tremendous job with the ST Notebook as far as
I can tell from what I know now. My first reaction was: "Can I take
it with me right now?" I've fallen in love with this machine at the
very first sight.

The PAD prototype, however, appeared to be unstable at CeBIT. It didn't
recognize a single letter I wrote. I was told that this was due to electrostatic
charge or something, but well...

Let me express that I am very pleased with the way things are going now

Unfortunately the guidelines aren't as far reaching as those of Apple's in their Inside... series. (If you want to write a good GEM application, get yourself a copy of them and adapt their rules to GEM.

Look and feel police wouldn't be such a bad idea either. An accreditation scheme for software that 'This product has been certified user friendly and conforms to Atari guidelines' perhaps? Unfortunately, I think GEM has wandered off on its own for a bit too long...

Steve.

>
> Thanks.
> - Doug

Well you will find a small PCB with a CPU fitted on it, all this has
to be removed, and you relace this with the 34 IDC connector,
this CPU was a Atari copout for some drive that stept at 6 ms, the CPU
take the Atari 3 ms , step pulses and buffers things up and gives out
6 ms step pulses, Note, one other feature is that you can't go over
80 tracks with this CPU fitted, and there is no side select fitted
either.
So remove the lot, and wire the 34 pin connector to the Main PCB...

Mark Choi writes:
)Every one repeat after me. There is no such thing, there is no such
)thing, there is no such thing....

Actually, I saw such an emulator at a local BBS once. The archive was approximately 300 kb, but I downloaded it anyway (at 300 bps!)--we all know why--but the gizmo required an extra drive and a BLiTTER, and since I had a 1040 STfm, I had none of these.
The README claimed that the emulator would emulate (!) an Amiga 1000 but not the HAM mode, and not the sound, and not... Perhaps it should have stated what it would emulate instead. I never got that clear. ;-)
Also, a copy of the Amiga Workbench was required.

The manual stated that there would be a commersial version available soon (this was the PD ver.), but I haven't heard anything since. Probably they gave up and bought an Amiga. Seems the easiest thing to do, and you can use both computers at the same time. (That's *real* multitasking, folks!)

Disclaimer: I live in my own reality, which isn't neccessarily yours. :-)

2469. Re: Two New Computer Announcements - CeBIT

Newsgroup: comp.sys.atari.st
Date: 1991-03-29 15:06:06 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Mar29.150606.11735@chinet.chi.il.us>
Source record: 233576

In this discussion, I somehow haven't picked up whether that wonderful expansion connector is going to be driven by light-duty things, the way the Mega connector is, or by drivers with some fan-out (and isolation) capability. The way discussion has gone, I fear the former (but don't know). And it has been mentionsd several times in the past that the 'weakness' of the Mega port made it hard for people to connect things to it. (come to think of it, likewise the parallel port, but that's not the point here).

One thing that I think would make a big difference in sales of these machines is software that would allow a connection to a PC such that the laptop could act as a remote keyboard for the PC, and also transfer files both ways quickly. Preferably built in to the laptop, and preferably able to install anything needed on the PC end itself. I'm thinking of Laplink here, and rather than inventing it again, Atari might not do badly to see if something could be worked out with the Laplink people.

I care very much about the sales of ST-compatible laptops; I have a rather nice application written for such machines. I'll join the chorus of "There has to be a cheap & easy way to put software into it". That just doesn't apply as strongly to PC-compatible ultra-lights, where there's probably already a machine that runs essentially the same programs to dock it to. You can take along a travelling copy of software from the 'home base' machine. Doesn't work for a non-PC-compatible, and will CERTAINLY be seen as a negative. Try to get into the mind of someone who has to load the ST version of Word Perfect onto his '386 box in order to transfer it to a laptop so he can play with a report while he's on a trip. Sure he'd only have to do it once, but I don't think he'd be thinking pro-Atari thoughts as he did. One entirely plausible idea is to have a floppy as part of a 'base unit' that would tend to stay home, as long as it was standard equipment.

How's this: a combination power brick, floppy drive and external video adapter, that plugs in to the expansion connector?

Don't anyone get too excited; these are just some ramblings. And by the way, who's the magic person who has to say 'this will happen' and make these officially-announced future Atari products? And has that person said that?
Steve saj@chinet.chi.il.us

2470. Character sets?

Newsgroup: comp.sys.atari.st
Date: 1991-03-29 15:41:02 UTC
From: mspacek@fquest.fidonet.org
Message-ID: <4qukZ1w162w@fquest.fidonet.org>
Source record: 233577

I've never messed much with character sets on the ST. Never had any
installed but the system default. Never thought about it much. UNTIL, a
guy showed me a little program the other day. It was called MACINTOS, I
think. It was like 4270 bytes long, went in his auto folder, and changed
the font to a Mac-type font. It changed the font on the GEM menus on the
desktop and the font all through programs that were run. So..
I got to thinking about installing an ANSI character set to make a
VT-100 terminal work better with a PC ANSI BBS, etc. So, I'd kinda like
to get some feedback about what character set editors are out there.
And do you need a utility to install them, or is it possible to make a
free-standing little program like the MACINTOS thingy that does it all?
Are there any collections of fonts floating around (like maybe with an
ANSI set?). I did get the character set editor that came across
comp.binaries the other day. Thats a start. I guess send any info in
E-Mail, unless you think its something everyone would want to read.
Thanks

The preceding opinions are my own and not those of anyone else who
might be registered on fquest.fidonet.org. All flames can be sent to
alt.flames since we don't read that here.

MARK: KNOCK IT OFF, MR. KNOW-IT-ALL COLLEGE BOY.

A representative of Atari Corp. ought to be able to disclose information about a new machine here without being rudely berated. This is Usenet, not some user-fight BBS run by adolescents.

It's hard enough to get information out of Atari Corp.* It doesn't help when you go out of your way to make Atari folks feel unwelcome when they do participate here. You're doing the longtime readers of this newsgroup a serious disservice.

TRH: Thanks for the information and your participation.

Uhh, regarding my just-now-posted message.. I forgot to mention that I
am using a mono monitor. Thought that might make a difference. I think
that Macintos program only runs on mono, but I'm not sure. Sorry about
posting this twice like this....

The preceding opinions are my own and not those of anyone else who
might be registered on fquest.fidonet.org. All flames can be sent to
alt.flames since we don't read that here.

2473. Help with MiNT and Neodesk

Newsgroup: comp.sys.atari.st
Date: 1991-03-29 17:09:37 UTC
From: dave@CC.GATECH.EDU
Message-ID: <9103291709.AA17191@cervantes.cc.gatech.edu>
Source record: 233580

I like using MiNT with the Background Program Desk Accessory
in GEM. I now have NeoDesk, however, and would like to know how to
run MiNT from the AUTO folder and have MiNT run NEODESK (just like the
GEM.PRG program starts GEM and loads the D.A.).
Any help would be greatly appreciated.

Greetings all....

I have once again encountered problems with my STe. It seems that my internal drive has decided that it doesn' want to work any more... It ucks, caue I dont have a harddrive, so I cant even boot up... Is there some known problem with the drives in the STe? It spins up on powerup, and when the boot process tries to read the drive it makes a buzzing sound and cant access it... Thi really sucks, since I opened the machine to put in memory.... Argghhh!

John

For those of you who aren't aware, Logitech has come out with the "Logitech ST" mouse - I know that B&C Computervisions in Santa Clara has it ($59.95), and Microtyme advertised it recently in one of the magazines. The Logitech mice for the PC are well-regarded, I have no reason to believe the ST mouse isn't equally nice. It's good to see a major company jumping into the ST marketplace...

2477. Mercury Authorship

Newsgroup: comp.sys.atari.st
Date: 1991-03-29 19:26:44 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991Mar29.192644.6885@lsuc.on.ca>
Source record: 233584

I'm a writer of Public Domain software. The real thing. I don't release tons of source code every year, but I've put out more than most other people in the world. That's not a huge boast, it's more an ironic joke. The truth is that there isn't much real Public Domain software released *anywhere* in the world at all. I'm proud to say that Henry Spence is the most prolific coder of Public Domain C that I know of and he lives in my city (Toronto, Ontario, Canada). Maybe it has something to do with weather. Anyway, for my own code, I don't care if somebody strips off my "credits" and claims the code for themselves. Anybody who really wants to know if a piece of code is mine can verify most of it. Most of it has been recorded fairly permanently on BIX and other fairly permanent installations. The point of my code is to help give people who use *my* code an "unfair advantage". They make money? Fine. I expect to make my own money anyway on other code I write.

But all this is, unfortunately a rare attitude. Most people who "release" code put on all kinds of restrictions on usage and requirements. I hate that. If you want to add restrictions I think you should keep your code off the Networks. Maybe you can pass it around on local BBS's, but Networks exist under and "understanding" that things that are passed around are for *everybody's* benefit *equally*.

Now, getting to the problem: I've just started to look at the source code to the Mercury UUCP clone with the intention of porting it to Sozobon C. Now, the author claims Copyrights and is distributing as Shareware, with the usual beg for money. Ok. I'm not exactly keen on Shareware, but it's fair enough generally. I've paid some good money to *some* Shareware authors already, despite the fact that my own finances are pretty tight. I appreciate hard work. I should. I've worked pretty hard myself. But as I look at this Mercury package, something strange stands out. There are NO credits given to ANYBODY else. The author claims FULL ORIGINALITY of his code. But when I looked at a couple of the files, some of the code looked sort of familiar. Gee. Didn't I see some of this before somewhere else?

As I said before, speaking only for myself, I don't care if someone strips off my credits regarding code that *I've* released to teh public domain. But if you do this to my "commercial" code I'll rip-your-lungs-out-sucker! And I generally go along with such sentiments in other peoples works. So here's my question: Does anybody feel that the author of Mercury has "illegitimately" removed credits of other peoples work? IE: has he removed credits off code from programs written by other people where the original authors specifically asked to keep their credits? If they didn't care, then I won't either, but if they did

care, well, I'll want to consider the matter before I send money. . . .

> Anyone got an idea what could be wrong? (Btw. sometimes the transfer
> completed successfully, using the same settings!?)

This might be a little late, but I've been away for a few weeks. Anyway, if your going through a VAX system you have to change the format of the file to fixed length records before you download. If you don't, it changes all linefeeds to carriage return-linefeeds. I don't know how other systems handle it.

There is a program called BILF for the VAX to do the conversion for you. BILF changes your file from stream-linefeed format to 512 fixed format and vice-versa. I don't like using 512 fixed length though because it pads the end of the file with nulls to fill out the last record. I wrote my own conversion program to use 1 byte fixed length records so that when you get it downloaded it has the correct length in the directory listing.

Hope this helps,
Greg Wright

one of the things I _like_ about the ST is that I can make it look like
about anything I want. There's no fascist lockstep on the user interface.
I can fire up gulam and make a imitation unix machine. Pcommand will act
like msdos, as if I ever would want that (can you say "boring"?). There
are all sorts of nifty GEM add-ins, and no silly little wall at 640K.

If you're a moderately competent programmer you can do this easily enough.
You can link the font data in with your program, which is what this MACINTOS
program you were talking about does.

> along the same line--is there any fast, easy, prepackaged way to get
>Uniterm to use a more standard character set?

What do you mean by "more standard" ? Uniterm 2.0 does a full vt220
emulation; uses the standard vt series character set, and also comes with
the ISO 2022 character set. You can't get more standard than that. If
that's not a good enough answer for you, then redefine the question...

2482. Excerpts from Gadgets' newletter

Newsgroup: comp.sys.atari.st
Date: 1991-03-30 00:47:44 UTC
From: kiki@uhunix1.uhcc.Hawaii.Edu
Message-ID: <12210@uhccux.uhcc.Hawaii.Edu>
Source record: 233589

The following was excerpted from Gadgets by Small newsletter number five:

MegaTalk (SCSI and serial communications board)

The Gadgets MegaTalk board is a multifunction expansion board for Atari Mega ST computers. MegaTalk plugs into the Mega's expansion slot, has two serial ports and a Mac SCSI port...With our fully compatible BIOS drivers, you can connect up to three serial devices to the ST at the same time. For instance, using Strata Softwares' STalker DA, we've connected three modems to one ST, and connected to CompuServe, GEnie, and BIX - all at the same time!
The MegaTalk is capable of exceptional speed - up to 921,600 baud (92,160 cps). The BIOS software which goes in your AUTO folder, allows ST software at usual baud rates (110, 300, 600, 1200, 2400, 4800, 9600, 19,200). You can kick in second gear, starting with 38,400 and go to 57,600. For those industrial strength transfers, put it in overdrive and run at 230,400 baud (Appletalk speed), 460,800 or 921,000 baud!
It is compatible with the upcoming TT high-speed serial port, and is base on the same Zilog SCC chip. If/when Atari releases a network for the TT, MegaTalk should plug in; we already support the Atari Lan specification. In the meantime, we are providing info to Atari developers so they can adapt some of the present ST networks to MegaTalk, to let you share resources (hard disks, laser printers, etc.) between several machines.
The MegaTalk ports are 100% Mac ready; you can plug straight into any Mac peripheral. It works like you think; plug in your Mac mini DIN-8 cables, run Spectre 3.0, select "LaserWriter" from Chooser, and start printing. Or plug into a Mac network and use it, including file servers, LocalTalk Postscript printers, and so on...
In addition, for the first time ever, Mac MIDI programs now work with Spectre GCR, with standard Mac MIDI interfaces. We have tested both the Apple and Passport MIDI interfaces, and they both work fine, as well as many popular Mac MIDI programs, like Finale, Vision, Master Tracks Pro, and Beyond.
The MegaTalk SCSI port has the same 25-pin connector you'd find on a Mac Plus or any Mac. Just plug in your Mac hard disk, and/or any other SCSI peripheral and off you go. It's that easy!
Besides hard disk, we've also tested a ThunderWare LightningScan hand scanner; it works fine. And we've plugged in a Mac CD-ROM drive; we now have gigabytes of Mac software handy.
The MegaTalk retails for $299.95 each; a pair of MegaTalk boards retail for $549; you save $50!

GBS SST030 (Motorola 68030 and 68881/68882 accelerator board)

The SST is a 68030 processor accelerator and high-speed memory board for the Atari ST. The current board configuration is only for the Mega ST, which has lots of inner space for the board (and more importantly, for the heat the

board generates). By the way, we are planning a board for the "smaller" ST's.
What's on the board:

68030 : The speed of the '030 depends on how much you want to
spend. We plan to sell the basic package with three
options: no 68030, or a 16 or 33 Mhz 68030.

68881/2 : The SST also has a socket for a 68881/2 floating point
chip, which will radically accelerate programs that use
it. The 33 Mhz option includes the 68882 coprocessor.

SIMMs : The board has eight SIMM sockets to allow you to add up
to eight megabytes of SIMM memory. We offer two memory
options: no SIMMs or four one megabyte SIMMs.

socket : a 96 pin Euro-DIN expansion socket for add-on boards.

If you run your programs in the low four megabytes of ST memory, they're going to bog down to eight Mhz, period. So we will provide a few utilities to help you make sure your programs are running in "fastRAM" if you have it. This is the sort of thing where you put our program into the AUTO folder and forget about it; it's easy to install.
Along with the above-mentioned things, we also plan to include a 64-pin socket, a spare 68000, TOS 1.6, a manual, a floppy, and a couple of other miscellaneous items. And, since eight meg of SIMMs pull lots and lots of power, we may also end up including a power supply to handle the increased demand, but we don't know for sure yet.
We're going to market the SST in an upgradable configuration. First, get the basic package and a 16 Mhz 68030. Later, add fastRAM for more speed. Later, upgrade the 68030 to a faster model, and so forth.
Installation requires the removal of the 68000 in your Mega ST, soldering in a socket (which we include), and plugging in our board into the socket. We strongly encourage you to have your dealer install the SST; clipping and soldering 64 pins on a Mega motherboard is not for novices. For those of you without local dealers, we are planning on having designated "authorized Gadget dealers" who will install your SST in your Mega for you.
The basic package SST without 68030, coprocessor, and SIMMs, is $599.
Price of SST options:

A: 16 Mhz 68030, $200
B: 16 Mhz 68030 and 4 1MB SIMMs, $460
C: 33 Mhz 68030, 68882 coprocessor, and 4 1MB (80 ns) SIMMs, $800

Planned availability of the SST '030 is April 1990.
For further information, contact:

Gadget by Small, Inc.
40 W. Littleton Blvd, #210-211
Littleton, CO 80120
(303) 791-6098 [Monday, Wednesday, Friday 8:30am-2:30pm MST]
(303) 791-0253 [Fax, 24 Hours]

--------------------------[end of excerpt]-----------------------------------

The size of the MegaTalk and SST '030 boards are estimated to be about 4"x5" and 6"x6", respectively. Other items covered in the newsletter include the Spectre 3.0 (now with Atari TT/68030 and MegaTalk support, keyboard improvements, French and German menu option, 1.44 meg floppy NOT supported yet, but planned), and a compatibility list of about 450 Mac software.

2483. HELP! Mono monitor died

Newsgroup: comp.sys.atari.st
Date: 1991-03-30 01:00:41 UTC
From: vovut@prism.cs.orst.edu
Message-ID: <1991Mar30.010041.11418@lynx.CS.ORST.EDU>
Source record: 233590

My SM124 died a few days ago. I was typing a paper and the screen suddenly went blank. The power light went off, too. I replaced a blown fuse, but every fuse blows out.

Can someone help? Please?

vovut@prism.cs.orst.edu

2484. Grey-scale multisync monitors

Newsgroup: comp.sys.atari.st
Date: 1991-03-30 01:14:22 UTC
From: kiki@uhunix1.uhcc.Hawaii.Edu
Message-ID: <12211@uhccux.uhcc.Hawaii.Edu>
Source record: 233591

Some people were interested in multisyncing grey-scale VGA monitors which
might be adaptable to the ST computers. A list of specs follows:

Manufacturer phone number
model horiz scan vert scan list (typical) price
==========

Princeton Graphic Systems (call local info in Norcross, Ga for phone)

Max-15 15-36Khz 45-120Hz $389 ($240)

o autosynchronous; capable of 1024x768 interlaced
o TTL/RGB analog inputs, sub-mini DB-15 cable supplied
o display size 230mm x 173mm (optimal)
o 90-132V AC switchable to 200-264V AC, 46-61Hz
o Warranty: 1 year labor, 2 years parts

Comments: currently unavailable for about 10 weeks, until a
new manufacturing facility is completed. based in
Georgia. warranty service in Georgia.

TVM Professional Monitor Corp 800 822-8168, (714) 985-4788

MG-11 15-38Khz 45-90Hz $349 ($225)

o autosync; capable of 1024x768 interlaced
o TTL/RGB analog inputs, sub-mini DB-15 cable adaptor supplied
o display size 250mm x 180mm (optimal)
o distortion: linearity <= 5%, pincushion <= 2.0mm
o user controls:
side - brightness, contrast, power switch
rear - horiz and vert pos, horiz and vert size, horiz sync
rear - TTL/analog switch, TTL mode dipswitches (4)
front - screen background invert switch
o 100-125V AC switchable to 200-240V AC, 50/60 Hz, 65 Watts max.
o Warranty: 2 years

Comments: fresh shipment just arrived to distributors. new US
facility in Ontario, California to be completed in '92.
able to fax spec sheets. warranty service in California.
branch office in Vancouver.

Tatung Company of America 800 827-2850 ext. 213, (213) 979-7055

MM-1295/1495 15-35/38Khz 50-70Hz $349/369 ($225/???)

o CRT size 12" for MM-1295, 14" for MM-1495
o autosync; capable of 800x600
o display area 210mm x 160mm (MM-1295), 240mm x 180mm (MM-1495)
o TTL/RGB analog inputs
o User controls:
side - brightness, contrast, power
rear - horiz and vert center, horiz and vert size, vert hold
rear - TTL/analog switch
o 90-132V AC switchable to 180-260V AC, 50/60 Hz, 70 Watts max
o Warranty: 1 year

Comments: only MM-1295 in stock. other models may not be imported to to US because of lack of demand. warranty service in California.

3Lynx 800 243-5969

Intellisync 15" MonoVGA (specs unknown)

Comments: sales rep can't provide specs.

Other monitors by NEC (GS2A) and Goldstar (1405+) scan on discrete freqs and may not be able to properly sync to all the ST/TT video modes. Monitors listed above are of paper-white (grey-scale) color, although particular H17/H31 phosphor used was unspecified.

All information should be checked and corroborated before making any purchase decision.

I did nothing of the kind. I merely pointed out what I saw to be the
good points and bad points of this machine, based on a lot more than
just "let's compare it to the 520ST" attitude so many people have. I
have occasion to work with just about every major platform out there,
including the ST (Stacy4 and MEGA4, so don't say I do not have an
"interest in Atari", as TRH proposes!), Amiga 500 and 2500, 80x86 DOS
machines, DECstation 3100's, NeXTstations, every mac ever put out, from
the 128 to the IIfx, VAX under VMS, VAX under Unix, PDP xx's, sun
SPARCstations, and even a Silicon Graphics station and a LISP machine
from time to time. So what? I am not trying to show off my digital
omniscience? In fact most of the people on this net have more knowledge
about computers in their removed appendixes than I do! But I do know
what is out there, what has succeeded in the market, what has not, and I
have a pretty good track record in predictions in this regard. What is
Atari's track record? If it comes right down to it, the only success
they ever had was the 2600. That is not to say that their machines were
not fantastic, but they had no market share. And who the hell cares how
long you have been reading messages on this board? What the hell
difference does that make. Do you own it, due to your old-timer status?
And how am I doing anyone a disservice? They may disagree with me, but
am I stealing the food from their mouths, am I killing their first born,
give me a break. If you don't like what I say, then don't read it. Geez,
you'd think this was soc.women or something :^). Oh, so I suppose now,
because of what I said, Atari is going to cancel the notebook, and start

making PC-clones! My responses were amicable and polite in reference to all individuals involved. If I insult Atari Corp., and that is a crime, then most of the people on this board are criminals as well. Atari has cried wolf way to often for me to just jump when they say so.

> Excerpts from netnews.comp.sys.atari.st: 28-Mar-91 Response to Mr. Choi

> We need to make an actual machine, not constantly change to
> add in the latest pipe-dream.

1) No this could not be :^). It was just an idle speculation, No need to jump down my throat. It was hardly as large a leap of logic as you have made.

2)Look at the adds in Computer Shopper, babe. The VAST majority of notebooks (which means smaller that 10x15, usually much so, less than 8x10, and weighing less than 6 or 7 pounds) do have 1.44 meg floppy drives, 20 meg hard disks, AND external VGA support. Some even have an ISA slot. Granted, they have a battery life of only 3.5 - 4 hours, but they DO have these things. These *are* actual machines. Your above contentions are both misinformed, and misinforming. I expected better. And you think you know the market. You scare me.

This is what they said about every single machine they have ever put out. How many were actually released in the US first? Is the Stacy debacle all that far behind us. Remember that TT thing?
> Excerpts from netnews.comp.sys.atari.st: 28-Mar-91 Response to Mr. Choi

> Mr. Choi, if you know so much about what would be the perfect machine
> (as you appear to think) GO AHEAD, MAKE IT, AND MAKE LOTS OF MONEY. I
> ENCOURAGE IT. IT IS THE WAY CAPITALISM WORKS.

Where did I make one incorrect statement about the machines designs? You have not yet pointed to one error I made in this regard. I disagree with parts of the concept. This is not the same thing. I did take time to find out what the machine was. Why else did I post you looking for more info? I did not tear apart it's design, only aspects thereof. And you claim I do not understand your market. Where is your proof of this. Meanwhile I could find pooploads of evidence that Atari and the Tramiels do not understand the computer market. As far as your last barrage is concerned, I am a socialist so there :^). Actually, this is very annoying. It is the same stupid argument made by bad actors to defend against bad reviews. If the critic could act, (s)he would be acting, (s)he would not be a critic. I do not need to have the necessary background in engineering or the capital to start a entrepreneurial venture to be able to use a machine, or to suggest improvements thereto. IS THIS NOT WHAT THE ST WAS SUPPOSED TO BE ABOUT, ON BOTH COUNTS.
I also do not need to be able to build a machine to know what this machine would have to be. Are you offering me a job in you R&D think tank? I, along with a number of other *frequent* posters here COULD make you a machine that would sell, IMHO.
> .Excerpts from netnews.comp.sys.atari.st: 28-Mar-91 Response to Mr. Choi

> product.

How was what I said non-constructive? Are you a bit to emotionally involved to get an objective view, here? If you look at my posts, it is obvious that what I said was to improve the product, I even stated as much. This last little bit seems more like a burst of hot air to make you seem more open minded than you are, than a real response to anything I wrote.
> Excerpts from netnews.comp.sys.atari.st: 28-Mar-91 Response to Mr. Choi
> re: No.. T R Hall@atari.UUCP (4289)

> Maybe you just enjoy being nasty?

Who was nasty? Read YOUR post.
I just legitimately believe that the machine would be a huge success, both in the Atari world and without, if the things I suggested were done. Without them, I think it will be a small fish in a very small

pond, and not live up to it's potential. You disagree, fine. This is Usenet, and we are entitled to our thoughts and opinions. You, however, seem to think that you are more entitled to yours than I am to mine. I do not like to rant and rave on the net over personal affronts, but too many misstatements and assinine remarks were made in both the Steve Yelvington and TRHall letters to let slide. I am sorry for this bandwidth explosion, but that is going to happen every now and then on a pseudo free net. In closing I would like to remind Steve Y. and TRHall, assuming they ever even read all of what I wrote, that I said repeatedly that I liked this machine and that I wanted one. I just wished it were a bit more functional, and useful. How many people do you really believe are going to plop down 2 grand for this baby, and another $700-$2000 for another desk machine, with a lot of duplicated functionality. You seem to claim that one can not get a desk machine into a notebook, but the editors of various PC mags seem to disagree with you, putting out a large amount of articles about how notebooks now can be your only machine, are as powerful as desktops, etc.. If you wish to make personal disparaging remarks, shoot them with all due haste into me e-mailbox. If you want to make constructive comments, post to the net. Why do you have to vent your personal poop in front of an audience? TRHall, if your attitude is exemplary of the rest of Atari engineering, and management, then I think I may have made a bad purchase 5 years ago when I got my ST, a bad purchase 3 years ago when I got my MEGA 4, and the biggest blunder of a life time, when I mortgaged my soul to get a STacy 4. I should have waited, put my money in bonds, and used the earnings from everything I put into Atari to get a NeXT. If your attitude, and you crass display of emotionalism is a reflection of the company for which you work, then you suck, and deserve every loss in market share you have gotten, and will get. If not, I wish Atari all the luck in the world. I will stay loyal till I am told by enough of those in Atari such as yourself to go ahead and leave. Then, anyone want a STacy? This is supposed to be a good stance for a computer company to take to its users? No wonder your marketing stinks!

>So here's my question: Does anybody feel that the author of
>Mercury has "illegitimately" removed credits of other peoples work?

Part of Mercury UUCP (the outcalling version of UUCICO) was orginally written by me in GFA Basic and published in the public domain. Thus the Mercury author was within his full rights to use it as he saw fit.

In fact, he contacted me beforehand, and I specifically suggested that he could do as he pleased with it, *INCLUDING* take my name off it.

However, my name was still in the Mercury code I saw several months ago even though the new author had improved it by (using reverse engineering) adding the complicated code to allow incoming calls and probably other functional improvements.

I can't speak for anyone else, but I'm quite happy with the way Mercury was developed and published

2489. Telecom program help needed

Newsgroup: comp.sys.atari.st
Date: 1991-03-30 10:10:29 UTC
From: uuvvuu@mixcom.COM
Message-ID: <440@mixcom.COM>
Source record: 233596

I just purchased a used 1040 ST and SC1224 about a week ago and have a
few questions. Okay, really just one question: Which telecommunications
package do you use and why?

My observations so far:

UniTerm A really spiffy interface with some functions just where
I want them, others a mile away, or lacking altogether.
The emulations are immaculate from what I can tell,
but lack of Zmodem, or even batch Ymodem is a big
no-no for me.

Interlink Lots 'o features with a so-so interface. At least
everything seems available reasonably quickly. Why
I don't have control over whether or not a LF is
inserted when I hit CR in the buffer window is beyond
me. I'm currently using v1.82; I've heard that the
latest is v1.85 but it's buggy. The emulation .EMU
files I have seem old and definately have bugs; the
protocols work reasonably well. Dialing menu is too
short for me. I'd like a built-in _full_-featured
Zmodem.

ST TalkPro v2.0 is supposedly still unfinished, but again
supposedly has a lot of nice features. I haven't seen
it to comment. Have any of you?

Vanterm I was told to look into this product. I have yet to
see it or to hear any more than, "get it". Should I?
Why?

Since telecommunicating is the #1 thing I do with my computer, the
associated software is of prime importance to me. Any help with this
would be greatly appreciated. Please post, my E-mail quota is full (yes,
we have off-site quotas here).

Thanks!

The other day I downloaded several SPC pictures from bart, but when I tried to view them on my ST, using a specshow programme I found on bart, only the top quarter of the pictures was visible...the rest was a mess of lines...could the files be corrupt, or is my viewing programme just buggered?

Thanks,
Scott
.

2491. Mr. Pietrzak responds to: "Mr. Choi" responds to Atari (a flame)

Newsgroup: comp.sys.atari.st
Date: 1991-03-30 15:22:23 UTC
From: pietrzak@skybridge.SCL.CWRU.Edu
Message-ID: <1991Mar30.152223.22472@usenet.ins.cwru.edu>
Source record: 233598

Mr. Choi. I've just read through your thesis on how you have been persecuted on this board, and by Atari in general. In the last week, you have been quite active in writing to comp.sys.atari.st; let me summarize what you've said:

Saturday, March 23rd
Subject: Re: ST Pad specs
A message describing how pen-based computing has been established in the PC world, plus your opinion:
>I doubt Atari will really go the whole 9 yards with this. They have just
>jaded me too often in the past. I have STacy, so I know what Atari doesn't
>do right :^(!

Saturday, March 23rd
Subject: Re: Two New Computer Announcements - CeBIT
A message giving your "wish list" of what you want in a notebook PC, now that they've designed one at Atari. Plus, your opinion:
>BTW, I have STacy, and so I know how badly Atari can screw up in the
>portable market!

Monday, March 25th
Subject: Re: Two New Computer Announcements - CeBIT
A reply to a previous description of the design choices of the notebook ST. You refute them, and point to the PC world as well. Plus, your opinion:
>This thing would sell like mad if they could get it out in time (ie.
>before apple comes out with its soon to be released mac notebook) but
>I doubt atari learns anything from the past, and so I do not think this
>will happen.

Monday March 25th
Subject: Re: Two New Computer Announcements - CeBIT
In your disgust of current Atari hardware (especially the notebook ST) you bring up the point that Atari may be attempting to perform monopolistic practices, forcing people to buy Stacys instead of notebook STs. Plus, your opinion:
>I know th ST can be *used* in these other fields, but it is not versitile
>enough, and nopt good enough in any of these fields, except DTP/MIDI to
>really catch on. The hardware is O.K. for a lot of it, but the
>software/OS stinks.

Thursday, March 28th
Subject: Re: Two New Computer Announcements - CeBIT
An Atari employee attempts to explain design procedures for your earlier requests. Again, you refute him, pointing to your wish-list of notebook PCs, especially the external monitor request. Plus, your opinion:
>[...] But Atari the company. It *is* Blind/Dumb! And excruciatingly

>slow as well.

Which brings us to the message I am replying to.
Saturday, March 30th
Subject: "Mr. Choi" responds to Atari
You reply to several posts from people angry at you. You "defend you honor" with a long reply, again refuting most of the discussion of design considerations, as well as commenting on their style of posting.
Some of your opinions:
>My responses were amicable and polite in reference to all individuals
>involved.

>Your above contentions are both misinformed, and misinforming. I expected
>better. And you think you know the market. You scare me.

>If you look at my posts, it is obvious that what I said was to improve
>the product, I even stated as much.

>If you read my post, I find it hard to see how you can think anything I
>say berated TRH, let alone rudely (can one do otherwise?).

My point? Sir, you are WHINING. You have WHINED in every single post you put on the board last week, and you are WHINING in this one. Your style is corrosive; your opinions are self-centered; your "facts" are dubious, come from third-party sources, and are used incorrectly. You want something you cannot have, and are throwing a tantrum of great proportions to a network which sends your messages over the entire world.

Stop it.

2492. Opinions on gcc

Newsgroup: comp.sys.atari.st
Date: 1991-03-30 15:39:07 UTC
From: jason@cs.odu.edu
Message-ID: <JASON.91Mar30153907@lancelot.cs.odu.edu>
Source record: 233603

I recently noticed that an st version of gcc was available,
and I would like to know something about it before taking the time to
download and set it up. One thing I'm interested in is support for
AES/VDI system calls and how easily programs written with other st
compilers can be converted to work with this one. There is also a
mound of gcc related files at the archive site; does anyone have a
list of what's needed?

2494. memory problems

Newsgroup: comp.sys.atari.st
Date: 1991-03-30 20:48:31 UTC
From: fnjlh1@acad3.alaska.edu
Message-ID: <1991Mar30.204831.12866@ims.alaska.edu>
Source record: 233600

While chasing some problem that caused intermittent lockup w/ black screen, after trying heat and cool spray, and getting random bomb numbers, I finally removed the ZRAM, removed the MMU, treated the little pins w/ Cramolin (neat stuff), and reinserted. I tried to be carefull and worked on a static mat, tried to account for the little interrupt insulation that the ZRAM uses on one pin, but still ended up with .5M instead of the normal unenhanced 1M. I found this very discouraging.
Is there a specific pin that addresses each bank of memory, and where, as exactly as possible might it be on the mmu? Or should I bark up another tree entirely? I also fiddled with the video shifter in the ZRAM removal if thart could be implicated.
Thanks for any help. Stuck on my wife's 1M st... J Harris

2495. Re: Help with atari.archive

> sent 3 requests for help but have not even received any bounced mail. That
> must mean that I'm getting somewhere but the requests are falling in the
> 'bit bucket'.
> Thanx in Advance,
> Paul Moreau
> -----
> UUCP: ..!ccicpg!unix!paulm
> ^^^^
> BTW: my machine will soon have a real name not just unix.

I haven't checked the maps, but I wouldn't be surprised to find that ``unix''
is registered *somewhere* ... I would advise that you not even try to send/
receive mail until you pick a permanent name.

Assuming you don't have a smart mailer, you should be able to use the
bang-path To: ccicpg!uunet!atari.archive.umich.edu!atari to reach BART.
Start your message with the following line:

path uunet.uu.net!ccicpg!<whatever-you-decide-on>!paulm

... and BART should be able to find you.

If you have a smart mailer, just user atari@atari.archive.umich.edu

BART doesn't send error messages, so you won't get any bounced mail unless
an intermediate site can't find the Internet (which isn't likely if you have
a path to UUNET).

Good luck!

From: Duncan.Lewis@samba.acs.unc.edu
Message-ID: <3161@beguine.UUCP>
Source record: 233602

Having departed the ST arena for the slightly greener pastures of the (*gasp*) Amiga world, I find it refreshing to see a new face on the net from Atari. I'd really like to get more information on this Notebook pc since I still have alot of interest in a portable notebook like ST. I see this more as an accssory to an ST-desktop system tho.

I wonder if there's a 68040 station on the horizon for Atari? Maybe a workstation with some real horsepower. I found the TT a disappointment of sorts. Time for 24 bit color and big resolution. Anyways back to Mr. Hall, can you point me and others to a soruce of info on thsi notebook?

Thanks
-Duncan

From article <1991Mar29.192644.6885@lsuc.on.ca>, by jimomura@lsuc.on.ca (Jim Omura):
> [...] Now, getting to the problem: I've just started to look at the
> source code to the Mercury UUCP clone with the intention of porting
> it to Sozobon C.

A complete rewrite or porting *ix tools is a more promising approach in
my view. Maybe you want to stay in contact with us German folks so we don't
do things twice. We already have quite a few extensions/replacements.

> [...] But as I look at this Mercury package,
> something strange stands out. There are NO credits given to ANYBODY
> else. The author claims FULL ORIGINALITY of his code. But when I
> looked at a couple of the files, some of the code looked sort of
> familiar. Gee. Didn't I see some of this before somewhere else?

Well, the UUCICO is based on the Mailtruk by John Logajan and credit is
given in the Source. For the rest of the C code take a closer look: the
reversed parameters in standard things like eg. strcpy tell me that he
can't have used more that a couple of lines from somebody else without
getting in a real mess. (aeh, more than he already did)

I'd be glad if he _had_ used some code written by somebody else. Sigh.

2498. Re: Need a cooling fan for my 1040ST with ZRAM upgrade

Newsgroup: comp.sys.atari.st
Date: 1991-03-31 00:23:00 UTC
From: adamd@rhi.hi.is
Message-ID: <2994@krafla.rhi.hi.is>
Source record: 233605
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

In <1991Mar26.192606.8264@cs.wayne.edu> pbh@jake.cc.wayne.edu (Patrick Haggood) writes:

>> J. Harris writes about how his ST with ZRAM stops running after a few
>> hours, then when left off for 2-3 hours, boots fine.

>I've been having the same problems with my ST. I figured it was heat,

It could be heat affecting the memory board, heat from the power supply
spreading through the metal shielding and motherboard, or the Atari power
supply is pushing its limits.

By far the most heat in the computer is the power supply. I haven't
calculated the power loss in that supply but it doesn't look very efficient.
There are two choices available. A fan was already mentioned. The best place
in a 1040 for a fan is just to the right of the power supply, blowing upwards.
A good fan would draw most of its air from the side where the power supply is.
Venting slats also have to be opened up in order to get a reasonable airflow.

I chose the other (and probably simpler) solution. I removed the power supply
altogether and fitted a diskdrive power connector where the switch used to be.
Plug in any off-the-shelf power supply and go. All the heat is outside where it
belongs, also there is no danger of accidently pulling out the (DC) power cord
because it is a snap fit. I have room in the computer box now for an internal
hard disk and am not restricted to using the standard Atari PSU with all its
shortcomings. If the standard PSU must be used it can be mounted in an aluminum
box. To avoid RFI leakage it is a good idea to use a screened cable for the DC
power and close with metal the hole where the AC power cord used to plug in.

I hope this will help someone.

L.J... does your "kill file" include "potty mouth" comments from our
revered "Atari representatives"...?

Funny how they can drag a discussion down into the muck with personal
attacks and foul language.. ("piss in my coffee"... "you haven't the
faintest idea what-in-the-fuck you're talking about") and still have
the resident Atari cheerleaders jump to their defense...

It's also funny how some users of this newsgroup can drag a discussion
down into the muck by continually pissing in everyone's coffee and
babbling on and on when they haven't the faintest idea
what-in-the-fuck they're talking about.

Is this any way for representatives of a major computer company to talk
to the public..? We're all in pretty serious trouble if we have to
accept abuse like this just to have the "honor" of their presence here...

No one is forcing you to read the messages by anyone from Atari, just
put atari.UUCP in your kill file and you won't have to take any more
abuse, at least from them. You'll still get abuse from the rest of us
unless you stop bitching and griping and start posting something
useful here.

By the way, most of the Atari folk here are on Usenet on their own
time, NOT as representatives of Atari (or have you failed to read the
disclaimer attached to their messages?) Personally I really appreciate
their presence here and wish assholes like you would quit giving them
reasons why they should discontinue that presence.

Your friendly resident Atari cheerleader,
entropy

2501. Re: Standardized GEM look and feel

Newsgroup: comp.sys.atari.st
Date: 1991-03-31 04:37:22 UTC
From: rosenkra@convex.com
Message-ID: <1991Mar31.043722.10904@convex.com>
Source record: 233607

when i wrote the "innocent" statement that there is no real GUI standard for GEM, i was thinking along the lines of Motif(et al)-like standards which are widely distributed and for the most part widely accepted and adopted. sure, all atari GEM application that use windows have the closer box in the same place, the sliders in the same place, etc. most of them even function the same. but there is more to a GUI standard than just how windows look on the screen.

a GUI standard has pros and cons. the major pros are:

o app "looks" and runs the same under many different platforms
(and yes, i understand that GEM applications only really run
on GEM systems: ST and PC)

o (hopefully) applications can be ported easily to other platforms

these are EXTREMEMLY important pros in the big picture. it makes using applications very easy since learning curve is climbed only once. it makes writing applications more difficult, but in the long run easier since the ports are easier.

the cons are:

o restricted from lots of "cute" programming which is non-portable

o speed may be sacrificed

o some things can't be done or are awkward on a specific applicaion
domain (e.g. DTP, music, etc)

to this end, i still don't think there is any real standard. and there is no well adopted documentation on such a standard i can point to. if there is, few programmers follow it because it restricts "cute" porgramming practices (which i have nothing against, BTW, and often, on the ST at least, the thing which makes a program successful). the desktop is as close to a standard as we have, IMHO. and it is not that bad, either, though it is difficult to use if you are a heavy duty programmer (>1000 lines per week). of course, on the ST you have the distinct advantage of reverting to a command shell with a single double click on your favorite shell.

and if there IS a widely available document dealing exclusively with programming practices for GEM, i would sure like to hear about it, whether it comes from atari or elsewhere. note that i have most every book ever published (in the US) on the ST, including all those which are out of print (abacus, sybex, etc etc). i also have the developers docs.

Once you get use to TeX you can type math faster and neater than you can write it long hand. Also, although text editors are not good symbolic algebra systems, they can go substitutions so they are of some use.

Neodesk 3.0 comes with a PD font editor, and a small auto program that can replace the system font at boot time. Alternately, you can use a different font just within Neodesk (but have the regular one when you run programs). Pretty nifty.

I thought the ST's parallel port is output only. Surely one would
transfer data from the notebook/pad into a regular ST as well.

trh@atari.UUCP (T R Hall) writes (somewhat ironically):

> Could it be, Mr. Choi, that you haven't the faintest idea
>what-in-the-fuck you are talking about?

[self-important ranting deleted]

> You talk about note-books equipped with hard-drives, floppies, ISA
>bus'es etc. How many NOTEBOOK (NOT laptop/luggables) machines any ALL of
these,
>or even more than ONE of these.

TRH, do you really BELIEVE this? Why don't you wake up and smell what
you're shovelling?

I'm writing this on a Dell 320N (20MHz 386SX notebook computer) that
is also 8.5"x11", and guess what? It HAS an internal 1.44MB drive.
AND a 60 MB 19ms hard drive. AND 5MB RAM. AND an internal Fax/Modem.
AND a low-power VGA edge-lit LCD that diplays 16 shades of grey. AND
a VGA monitor port. It goes on.

> In case you haven't guessed, I am REALLY annoyed with Mr. Choi's
>whinings. He doesn't take the time to find out what the machine actually is,
>yet is prepared to tear apart it's design. He doesn't take time to even
>understand our market, yet is prepared to tear apart HIS SUPPOSITIONS of our
>marketing strategy.

This sputtering attack demonstrates perfectly why Atari has so much
trouble competing in this day and age. TRH has the gall to attack
someone who theorizes about the marketing strategy (apparently having
struck a nerve), but in doing so, he demonstrates utter ignorance of
the capabilities of similar machines.

The fact that people with this lack of awareness design computers
explains A LOT about Atari's problems.

> Otherwise, why not be a reasonable human being, and make
CONSTRUCTIVE
>criticism, based on (gasp!) actual knowledge?

Like I said. Ironic, isn't it?
> Or perhaps you aren't participating in the group because of
>interest in/support for Atari?

Ah, now we see it. Anyone who doesn't kiss Atari's ass when they
commit yet another marketing blunder is automatically a heathen, is
that it?

TRH, the REAL Atari enthusiasts are those of us who acknowledge the strengths of the machines they made before the company was infiltrated with incompetent hacks who are completely ignorant of what's going on in the industry, not the people who blindly accept and believe that the company can do no wrong, and then wonder why there's no support for their new toys.

I bought my Mega ST because, for my purposes, there was no better choice. I can't say that about the machine you describe.

>machine, are as powerful as desktops, etc.. If you wish to make personal

Well, I can't speak for others, but I haven't been the least tempted
to plop down 3 grand for a 386 "notebook" (heavy emphasis on the sneer
quotes) that weighs 3 pounds more than it should and requires lugging
around an extra 3 pounds of battery packs in order to extend the
pitifully short battery life. If doing without removable media is the
price for having a really light and useful machine, I'll be happy to
pay it. (You're not suggesting, are you, that we rely on the opinions
of the brain-dead editors of various PC mags as an indication of what
a good machine is? That's about as sensible as listening to art
critics.)

This was posted some time ago on comp.sys.atari.st.

--------------------------------------------------------------------------------

Installing a fan on my 1040ST was a sinch. First, I took the sucker apart.
(Warranty??? What warranty??? Oh yeah, do this 91 days after you buy the
machine.) There is a beautiful place to mount the fan between the power
supply and the disk drive right on top of the RF shielding. I just cut a
hole there about 2"x2" and mounted the fan with 4 screws. Since it was
a 12V DC fan, I just connected one wire to the +12V spot on the power supply
and the other to the negative spot. These are labeled on the power supply
so you should have no trouble finding them. Then I put the thing back
together. It fits perfectly. Just go to your local Radio Shack and buy
the fan. I think they have 2 models that will fit in this small space. I
can't remember the part number. It is about 3"x3"x1.5". It is really
quiet too if you put a small resistor inline or a potentiometer to slow the
fan down a bit. Even at full speed, however, the bugger is relatively
quiet compared to a pee cee fan. Bonne chance!

Have you seen NetBunny on the Macintosh? It's quite cute, but it only
runs on Mac's with 32-bit Color Quickdraw. You can set the Bunny
loose over LocalTalk and he will go across all the computers on the
net that have the NetBunny startup doc and 32-bit CoQD. Too bad the
ST doesn't have standard networking for all it's computers...

On an unrelated note, have you seen the silly DA siren? It makes a
little cop car drive across your screen with its siren on...

you can assign a function key to call an external zmodem. somebody
posted a macro file to do just that, and if you want I can mail you a copy.
You can also reassign keys to your heart's content. My 520 is a bit crowded
for uniterm--with what else I have (control panel and file selector) I don't
have room to have a history buffer, or run another program, but your
1040 should be plenty big enough.

> see it or to hear any more than, "get it". Should I?
> Why?
---
unless there's a newer and better version, this doesn't do any
fancy terminal emulation.
STTerm is available at atari.archive. No GEM goodies, very
"procomm"y feel, but will do vt-100.

>Since telecommunicating is the #1 thing I do with my computer, the
>associated software is of prime importance to me.

me too--amazing that I do all this character based stuff on my ST

Does anyone know anything about "the run" and "robocop" demos. I think ST Action (maybe ST Format) said they were both incredible. I haven't seen them on atari.archive, and was wondering if anyone could put them there?

Here are the trouble shooting instructions from my ZRAM board:

MACHINE BOOTS FINE WITH NO EXTRA MEMORY: Visually check every RAM
chip pin to make sure no pins are bent or out of the socket. This
is very common. Other possibility is pingrid board is not making
contact. Reseat pingrid board. If problem still persists make
sure epoxy is still on the two pins of the pingrid board. If off,
follow directions below.

PULLING THE BOARDS OUT. AIRGAPS LEFT: If you pull out the pingrid
board and try to boot up the ST, you will not be able to do so
because of the two epoxied pins leaving air-gaps in the contacts.
Inorder to fix this, pull out the MMU chip and take a pointed
razor blade and pull the socket contact out towards the MMU.

EPOXY FALLEN OFF: Follow above directions to pull out the MMU chip.
Inspect the chip to make sure that all the MMU pins are straight and
do not short on the bottom. Straighten with fingernails if needed.
Now get some electrical or masking tape and cut a very thin piece
and put it on the MMU socket contacts pin #8 and #18 where the
epoxied sides of the pingrid board go in.

According to the MMU pinout diagram the two epoxied pins, #8 and #18
are RAS0 and RAS1, respectively.

I had the same problem with my machine only recognizing .5 MB of
memory. My problem was that the epoxy had come off pin #8. If
the instructions above do not help, try calling the company. They
were very friendly, and helpful to me. ZRAM is made by:

Zubair Interfaces, Inc.
5243B Paramount Blvd.

In this list, games have been rated on a scale of 1 to 10, 10 being the best and 1 being the worst. For each game, the total number of votes, the average rating, and the vote distribution are shown. New games are indicated by a "*" before their entry. If a "(C)" appears after the title it means that the game is a CD-ROM or disc system title. If a "(J)" appears after the title it means that the game is currently only available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting

2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the
percentage of votes for each ranking. The following character codes can
appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes
"1" 10-19% of the votes "5" 50-59% of the votes "9" 90-99% of the votes
"2" 20-29% of the votes "6" 60-69% of the votes "*" 100% of the votes

Please consult the article entitled "ABOUT THE VIDEO GAME RATINGS REPORT"
in the newsgroup rec.games.video for more details, including information
on how to vote.

2523. VIDEO GAME RATINGS BALLOT [ATARI]

Newsgroup: comp.sys.atari.st
Date: 1991-04-01 06:09:49 UTC
From: erc@radon.berkeley.edu
Message-ID: <41532@ucbvax.BERKELEY.EDU>
Source record: 233630
Cross-posted to: rec.games.video,rec.games.misc,comp.sys.atari.st

To use this ballot, just hit "R". Once in your editor, insert your game rating between the word "vote" and the system code and game title. Your rating must be an integer between 1 and 10. There must be at least one blank on either side of your rating. Make sure the word vote appears at the start of each rating.

If you do not want to rate a particular game, just DELETE THAT LINE FROM THE BALLOT. When you are finished, SAVE THE FILE, and exit the editor. The votes will be sent to the game rating tabulator.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

If you want to vote for additional games, just add them at the end, in a format similar to the existing entries. Be sure to include the system code right before the title. This code is one of the below:

AL = Atari Lynx AM = Commodore Amiga
GB = Nintendo Game Boy GS = Apple II GS
MA = Apple Macintosh NE = Nintendo NES and Famicom
PC = IBM PC, PS/2, and compatibles SG = Sega Genesis and MegaDrive
SF = Nintendo Super Famicom ST = Atari ST
TG = NEC TurboGrafx-16, TurboExpress,
and PC Engine

Thanks for participating in the rec.games.video ratings poll. (This text was adapted from Chuck Musciano's rec.arts.movies ballots and John Leo's rec.games.video ballots.)

PLEASE DELETE TITLES WHICH YOU WILL NOT BE VOTING FOR.

v--- place your rating right here!

Cold anybody explain why Turbo C 2.0 takes a long constant like this:

ffff8e20 and turns it into -> 8e20 then takes
00ff8e20 -> ffff8e20???

I had this occur when I was working on my app program..MOST ANNOYING.

It seems to only generate the correct address when you insert the two 00's
????

2525. Atari cpu evolution

Newsgroup: comp.sys.atari.st
Date: 1991-04-01 07:31:56 UTC
From: kiki@uhunix1.uhcc.Hawaii.Edu
Message-ID: <12229@uhccux.uhcc.Hawaii.Edu>
Source record: 233632

[someone speculates about evolution of Atari TT models with Motorola 68040 cpu]

I guess it would be safe to assume that Atari is considering the '040 cpu for their next generation along the TT product line. But the microprocessor spectrum has shifted from the dominance of the 80x86 and 68000 families from Intel and Motorola. One alternative is mentioned by the author of the following article. And although he seems to disdain the specifications of the chip, I think it might be of significance and worthy of serious consideration.

------------------------[start of article]-----------------------------------

>From: neideck@kaputt.enet.dec.com (Burkhard Neidecker-Lutz)
Subject: PgC 7600 (was Re: Second-generation RISC)
Organization: CEC Karlsruhe

I'm typing what I've read in a local computer magazine here in Germany.
The magazine isn't exactly known for overwhelming accuracy, so beware.

Summary: I'm underwhelmed.

Done by small British company called PgC, Ltd. (Yawn). Funded by Clive Sinclair (Oha !). RISC machine with a couple of onboard systems to make cheap machine implementation possible. The components:

- Timer (connects to IFU)

- Serial control unit (SCU) connects to IFU and external world

- Instruction Fetch Unit (IFU) connects to ECU and external world

- Execution Control Unit (ECU) connects to a ROM and QCache

- CPU 6ns self clocking design coupled with 160 Byte of 3ns RAM

- Memory Controller (MCU) connects to CPU, QCache and external world.

The ROM can be used to store emulation code for CISC instructions (I assume this is similar to what Clipper has). Price abotu 600 Deutsche Mark (400 $)

External RAM interface:

Separate Data and Address, 160 MByte/sec. bandwidth. Qcache is 32 instructions deep. Integrated support for dual-ported SRAMS in MCU, claim that this enables multiprocessor systems. At last a (buggy) table showing planned routes into the future:

Name When Price Technology MIPS
PgC7600 1/91 400 $ Bipolar 200
PgC7610 2/92 40 $ CMOS 80

PgC7620 1/93 100 $ Bipolar 250
PgC7700 2/93 400 $ CMOS 1000
PgC7710 4/93 200 $ Bipolar 2000

If you ask me: Too little, too late, no serious performance, no software.
Forget it.

Burkhard Neidecker-Lutz, CEC Karlsruhe

------------------------------[end of article]--------------------------------

If the PgC series has the capability of adaptable microcode and CISC emulation, then it would merit consideration by Atari as an alternative to the Motorola 68000 line. At the very least, it would offer Atari a little leverage against Motorola's monopoly of the '030 and '040 market. At best, Atari would have a computer that could run 80x86/68000/6502 etc. binary code, by loading the proper microcode.

Although the German author perceives the PgC chips as unviable, there are other firms that are ready to market similar chips (NexGen, San Jose, CA) that have CISC emulation and multiprocessing capabilities. The pricing and performance seem to be exceptional to me and are some of the qualities associated with Clive Sinclair (and perhaps Atari), so that a Timex 200000K could soon be in our hands?

The British press probably has reported on the PgC chips more extensively and I wonder if anyone there could make corrections, additions and their perspect-ive on the preceding information?

Thanks,
Jack

2526. Notebook vs Laptop

Newsgroup: comp.sys.atari.st
Date: 1991-04-01 07:32:25 UTC
From: macdonaldk@watt.ccs.tuns.ca
Message-ID: <1991Apr1.033225.1@watt.ccs.tuns.ca>
Source record: 233633

I think Mr. Choy's concern about Atari's notebook is due to a confusion between what constitutes a notebook computer. From his remarks, it appears he wants the features of a laptop computer (e.g., Compaq or Toshiba) squeezed to "notebook" dimensions (NEC ultralight?)

Considering the limitations inherent in running a computer on only a couple of watts, I think Atari did what was only possible.

Kevin Macdonald
Technical University of Nova Scotia

Message-ID: <1991Apr01.084209.1802@ecst.csuchico.edu>
Source record: 233634

neil@cs.hw.ac.uk (Neil Forsyth) writes:

- I also read here once of a unreleased product that somehow escaped
- called a PS3000. I believe it was a SM124 like monitor with a built
- in floppy drive. I guess, when combined with the old driveless 520ST,
- it looked about as Mac like as an ST could get. It would look pretty
- swell on top of a Mega now.

The PS3000 was released. I've seen a couple of them. They're pretty
neat. It's a color monitor (good JVC model) with a single-sided
drive built-in on the lower right hand corner.

- Not only that but the first STE that ST World (UK) reviewed was
- badged as a 4160STE though I never saw that for sale. Nor a 2080STE
- for that matter.

I saw the 4160STE at San Jose WOA. As I understand it, Bob Brodie
wanted it named that way so he could distinguish it from the other
1040STe's when he travelled. What's weird, if you look on the side
of the boxes that Atari ships the STe's to their dealers, you will see
that there's designations for 520STe, 1040STe, 2080STe, and 4160STe.

2529. Expansion cases - Compatibility with hardware?

Newsgroup: comp.sys.atari.st
Date: 1991-04-01 12:08:37 UTC
From: SAMcinty@exua.exeter.ac.uk
Message-ID: <1243@exua.exeter.ac.uk>
Source record: 233636

There are a number of companies here in the UK as well as on the continent which offer some sort of a hardware expansion box for the 520 and 1040...basically just a large empty box that you can put your motherboard and most other things inside of...space for several hard drives, floppies, etc..

My question is: With the high number of graphics cards and add on processors available for the Mega, would it be possible to invest in one of these tower cases, then get the add on card and have it work, even though the machine is still a 520 or 1040?

Anyone know?

Ta,
Scott

Message-ID: <1991Apr1.142122.14952@lonex.radc.af.mil>
Source record: 233639

I have been a silent observer of the recent flame war which has degenerated to the point of name-calling (immature at best) and profanity (a nice word for the method of displaying one's inability to express themselves) directed against various members of the net. Would you allow me to post a few objective observations? (well here they go anyway)

1) I understand that some users get their net feeds at their OWN EXPENSE! This means they, unlike the rest of us who read this drivel on our companies machines, actually have to pay to download repetitive articles from the waring parties. Many of these include vervatim quotes of the previous zillion posts on the same subject. Lesson: If you must flame, do it succinctly, including only those lines of the previous post which are directly applicable to your message!
2) Seldom do flame war combatants respond to other flames from other observers without simply expanding the arena of conflict (that is why it is called a flame war, just like a fire, it ignites those around it). I think a Personal Appeal, using E-Mail (and thus sparing those who pay to read), is more effective in communicating your point.

3) Lastly, this is a great newsgroup, much more active than almost any other Comp.Sys newsgroup you can find on the net. As an example, I logged on this morning (Monday) after having read all the newsgroups I usually look in on last Friday afternoon. In the intervening Holiday Weekend, I saw the following newsgroup status:
comp.sys.atari.st 27 unread articles:
comp.sys.amiga 6 unread articles:
comp.sys.mac 2 unread articles:

MY POINT IS: This is a great, active newsgroup! Let those who flame have their little battles, and E-Mail your appeals for calm to them personally!

P.S. I am sorry for the length of this post (for those who pay to read) but I hope this will save unneccessary postings in the future.

Ther are several on the market that will copy disks.....

1)Pro Copy this is a standard copier that works pretty well
2)A Copy the best one I think it works well
3) Fast Copy anoter good one
I've seen f copy public domain but A copy anb Pro Copy
will run you about 10-25 bucks each

So if I splice into the composite line of the monitor, I should be able to
get composite output? It sounds a little too easy. Why would anyone buy
that Video Key thing then?

A while back someone posted a list of videogame magazines in one
of the newsgroups (either 'rec.games.video' or this one -- I can't
remember which). In it they mentioned "Video Games & Computer Entertainment"
and "Computer Gaming World," and the message noted that one of these
magazines was apparently published by the people who put out "ST Log."
I was wondering if anybody knew which of the gaming magazines was
the one that was put out by the "ST Log" publisher. Does anybody know
for sure?

>.... Um, if *all* the address lines are
>present, does this mean the CPU is now allowed to address its full 16MB
>address space? Or does the GLUE still bus-error on writes outside the 4MB
>limit?

> -- Howard Chu @ Jet Propulsion Laboratory, Pasadena, CA

Actually, the way the Glue chip "Bus Errors" is that it has a
(minimal) timer that watches /AS. If /AS is longer than 1uS (1000nS) than
it generates a /BERR. So, the CPU CAN address the full 16MB space; the
circuitry in the GLUE was to make sure there is a BERR in any un-occupied
space. Your circuitry can generate a DTACK to any space (that the glue doesn't
respond to), and if it keeps /AS under 1uS, then everything is fine.
[I probably shouldn't say this part, but what the heck...]
For those who really want to kludge, you could even respond to
accesses that are in spaces the Glue decodes, but doesn't respond to, such as
WRITES to ROM spaces. Of course, you can't READ what you wrote (because of ROM
responses to read), but the writing part of the kludge would work.

> ----------> to Printer STROBE

Would just a diode work - connected in the STROBE line with cathode towards the Atari? It would be simpler to wire in. It would prevent the printer from pulling the atari low on this line. It would require the Atari to sink more current in the low state (than the transistor), but not any more than with the direct connection.

Hello -

Does anyone out there have any experience with the Sozobon C compiler? I'm trying to write a program which uses a good deal of floating point math to produce fractals and I just can't get it to work. The program seems to compile fine, but when I try to run it I keep getting a "Stack Overflow" error. I have ported the program to other systems (UNIX, MS-DOS) and it runs fine, but the atari just won't do it.

Help!

2545. Couldn't Atari take over the education market?

Newsgroup: comp.sys.atari.st
Date: 1991-04-01 23:44:54 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <4552.27f77fa6@miavx1.acs.muohio.edu>
Source record: 233651

Since it seems that Apple is ready to drop the // line and push Mac onto the schools to replace them, I think now is the time for Atari to pounce on the education market.

The only requirement would be to construct a Apple //e emulation cartridge, like Spectre, but put a 6502 on board and have the user purchase the Applesoft ROMS somewhere else. (I heard that they are going for $20 a set now!) Be able to read write 3.5 PRODOS disks, and have the ability to hook up a 5.25 Apple drive. I believe schools would eat this up! They would be able to buy 3 STEs for the price of one Mac LC.

What are your thoughts?

From: jan@janhh.hanse.de
Message-ID: <3865050@janhh.hanse.de>
Source record: 233652

Hi!

Since this subject keeps comming up since quite some time, here is
an article describing the cause of the phantom typist (including a
"source listing" of the buggy part of GEM). We sent this to Atari quite
some time ago but never got an answer.

The author of this article is a friend of mine who is not reachable
via email, Wolfram Roisch. If there is a need I will forward mail to him.

Happy trails,
Jan

THE SYMPTOM

in article <881030205326.543196]PCO-MULTICS.HBI.HONEYWELL.COM>,
Friesen@PCO-MULTICS.HBI.HONEYWELL.COM says:
> I get the wierdest errors...
[...]
> strange things started happening. As I typed
> in 'ing ' at the end of a word, the computer started hiccupping. I
> still got the "key-click" sound, but it wouldn't disply what I typed,
> instead it kept duplicating the 'ing ' of the last word I typed. After
> it did this about 15 times, the system froze with 2 bombs, and I had to
> reset. When it duplicated the 'ing ', it did it at the same speed that
> I had originally typed it in, and as it reached the end of the line,
> Flash still triggered its wrap-around.
>
> If anyone could figure this out, they sure deserve a pat on the back!
>
> Aric Friesen

in message <27334@cup.portal.com> Bob Retelle@ucbvax.Berkeley.EDU found:
> I would be typing in new text at the bottom of the text buffer..
> A series of quick backspaces would trigger the "phantom typist", resulting
> in the last 10 or so characters being repeated over and over, until the
> system crashed...

THE CURE

in article imagen!atari!danscott]ucbvax.Berkeley.EDU (Dan Scott) knew:
> Do you have a joystick or other similar device plugged into your ST? It
> is a known fact that Proline Joysticks (The ones that work on the 7800
> game system) will cause the ST to act in the manner in which you described.
>
>Dan Scott

> Happy Halloween!

(The Joystick Fire is hard-wired to the right mouse button. If you have
a joystick attached to your ST, make shure the Auto Fire switch is turned off
when booting or running GEM programs..)

in article portal!atari!kbad@apple.com (Ken Badertscher) knew:
> Now why doesn't that surprise me? Not to bash GST, but I have found
> that a lot of problems similar to this are a result of bad programming
> practices. Not intentional, but just because the developer wasn't
> aware of some restriction or another. It's all too easy to blame TOS.
[..]
> I strongly suspect that the problem is caused by mixing input modes
> between AES/VDI/GEMDOS/BIOS. That has been known to produce results like

> keyboard and dance about, chanting at the monitor.
>
>Ken Badertscher (ames!atari!kbad)
> Atari R&D System Software Engine
> #include <disclaimer>

THE MEDICINE

in <27180@cup.portal.com> Bob Retelle remarked:
[..]
> possibly I didn't sprinkle enough dried chicken blood around my ST, as
> I've had the "Phantom Typist" hit me while using FLASH as a text editor...
>
> Seems odd that someone who's been so involved with the ST has never heard
> of this "feature" that's existed as long as the ST has been available...
>BobR

and in <27334@cup.portal.com>:
> It didn't happen often, but when it did, it was terribly annoying...
> I wonder if Ken knows where I can buy a new supply of dried chicken blood..?
>BobR

in article att!oucsace!bwhite@ucbvax.Berkeley.EDU (Bill White):
> After days and days of using FW+ in an attempt to get the
> Phantom to appear, I finally did it. Unfortunately, I didn't have my

```
> logic probe with me right there,
[..]
> Anyone out there have a logic analyzer they'd be willing to send
> me for further testing???
>| Bill White Internet: bwhite@oucsace.cs.ohiou.edu |
```

THE SURGERY

The Ghostwriter disease is caused by a "coincidus interruptus" (as we voodoo doctors say). Input buffers overflow when interrupts of different priorities collide in interrupt coding like this:

```
struct { /* GEM AES storage segment */
..
struct tRec /* application recording as described in Appl_tRecord() */
{ void(* t_who)(); /* routine */
long t_how; /* arguments */
} recs[32];
..
}
```

```
> void /* enqueue input for forker */
> forkq( void(* who)(), long how)
> { reg struct tRec* rec;
> extern fpcnt, fpt; /* fork-pipe-tail index */
> if( fpcnt < 32)
> { rec= (long )((fpt++ << 3) + &D.recs);
> if( fpt == 32) fpt= 0;
> rec->t_who= who;
> rec->t_how= how;
> fpcnt++;
> } }
```

(copyright by Digital Research Inc, 1985, April 15 (!))

This routine is used to queue inputs for later use at dispatch time. It is called in interrupts from the VDI input vectors (timvec, butvec and motvec) as well as non-interrupt from a keyboard check, application replay (appl_tplay) or mouse change to cancel a double-click.

Tick-tick-tick-CRASH! - Revenge of the Ghostwriter..

What happens if forkq() is called non-interrupt, the fpt index is at 31 and the code gets reentered (interrupted) between fpt++ and if(fpt == 32) ..?

To exorcise one may
1) Replace expressions like ++i; if(i == ANYPOWEROFTWO) i= 0;
by ++i &= (ANYPOWEROFTWO - 1)
2) make sure the interrupts are disabled whenever forkq() is called (from chkkbd(), mchange() and ap_tplay())
3) recompile, assemble and link the system.

Any questions?

2548. Atari SC1224 Color Monitor for sale

Newsgroup: comp.sys.atari.st
Date: 1991-04-02 01:08:55 UTC
From: cwc@nut.cs.odu.edu
Message-ID: <1991Apr2.010855.4702@cs.odu.edu>
Source record: 233654
Cross-posted to: misc.forsale.computers,comp.sys.atari.st

I have an Atari SC1224 Color Monitor + monitor master for sale. This is the type of monitor with the dials on the side. $185 takes it -- which includes shipping anywhere in the continental US. (via UPS or USPS -- your choice).

Terms of sale:

After I receieve your M.O. or check, I send you the monitor. If it doesn't work when you get it, I take it back. If it gets there without any problems it's yours forever. ;-)

Just one word ahead: Go out, sell your SC1224 and get an SM124 instead. Most comm packages perform best on a monchrome display.
I use Rufus, a german comms package written by Michael Bernhard. It has build in X- and Y-modem and uses the GRZ/SZ-zodules for zmodem. It's quite fast, supports all resolutions, including the TT resolutions; uses different fonts (with GDOS) and has a built in batch interpreter.
Now, why do I use it? It's fast and reliable, it has the best ansi-emulation I've ever seen and offers a lot of possibilities. It's shareware, the fee is 50 DM, that's 30-35$.
The only problem for your is that Rufus is in German, but i've heard rumors about an english version floating around...

Hey, quickie question... has anyone out there had any dealings with Sideline Software in Florida... I ran across their add in the Mar. Current Notes and really liked the prices. Really liked their prices, really, really low... perhaps $20 below nearest competitors on some stuff. Maybe too low.

Does this company actually exist and do they actually sell what they advetise at what they advertise (14.95 for a game that everyone else has for about $32.95 or more).

Just wondering before I give'em my visa carsd no...

>Would just a diode work - connected in the STROBE line with cathode towards
>the Atari?

There is no amplification in a diode, and it has a forward voltage
drop anywhere from .3 to .8 volts. This added to the low current drive
capability of the Atari strobe line puts the "0" voltage up into the
1.0 - 1.5 volt range. I'm not sure if the HP requires TTL levels or
CMOS levels, but the minimum low of TTL is usually spec'd at 0.8 volts.

You could try it though. If you drop bytes or your print routine hangs
often you'll have a good guess why. :-)

Besides, how hard it it to solder three wires instead of two (33% harder :-)

> for sure?

Yes, Video Games & Computer Entertainment is published by LFP. That's
Larry Flint Publishing. I haven't picked up an issue for a while, but at
first running down the names of the people involved with the magazine was
like reading the same list in an old ANALOG magazine. Many were associated
with Atari computer magazines for years.

Message-ID: <7882@jhunix.HCF.JHU.EDU>
Source record: 233666

Help!

I have an old Atari SH204. I am considering upgrading it. I would like to know what success people have had with changing the drive inside. Also, I can get a 42MB 3.5" HD for ~$200 new. It is a SCSI drive however, and I know that the SH204 uses an MFM drive. Can I use HDX 3.01 to format the new drive? Anyhow, I hope I can get help.

Dom

2561. Re: memory upgrade woes on a Mega 1: SOLVED

Newsgroup: comp.sys.atari.st
Date: 1991-04-02 07:33:47 UTC
From: wilko@idca.tds.PHILIPS.nl
Message-ID: <1249@idcapd.idca.tds.philips.nl>
Source record: 233667

Mega 1's are available in most of Europe I think, in any case in Germany and Holland.

Regarding the memory upgrade: the problem was cured by adding a HEAVY gauge piece of copper wire, connecting the ground of the RAM expansion board and the ST board. How the ground connection could lead to a ST recognizing the expansion as 128Kbyte remains unsolved. Anyway, it works.

Related question: how about cooling the power supply? Mega1's don't include a fan, and the case becomes pretty hot. Anybody had a meltdown yet 8-)???

2562. Graphics on the STE - v. generally speaking...

Newsgroup: comp.sys.atari.st
Date: 1991-04-02 08:15:13 UTC
From: SAMcinty@exua.exeter.ac.uk
Message-ID: <1245@exua.exeter.ac.uk>
Source record: 233668

I've posted a few bits and pieces lately about the graphics capabilities
of the ST series, but I don't seem to have learned much, so, here are
all my questions....if you can help me, I would greatly appreciate it...

1) I have a 520 STE (w 4/meg add on)...and the SM 124. I asked a few
weeks ago about graphics on this kind of system, and a number of people
all suggested that I look into GIF stuff...I have been doing so, downloading
dozens at a time from wuarchive, and viewing them on the PC that does the
downloading - they all look brilliant. But when I get them home they look
crap.
Is the usual method of de-giffing a colour (heck, even mono) picture
onto an ST merely the clumping of black and white dots, at a horrendous
resolution? I know that a lot of effort went into writing these programmes
out there, but it seems amazing to me that on the VGA system (yes, I know
it has better graphics) it can look so amazing, and on my ST it looks like
someone sneezed! Am I doing something wrong? I've been using ViewPic which
is very nice for loading gif images, and works in mono or coulour (but looks
bad either way...the colours are all off), but the gray images still look
like nothing more than clever optical illusions...

So...:

2) Does the STE have gray scales, you know, proper shades of gray, not
just the nearness of black and white pixels? How can I use these scales?
When I look in magazines I see some AMAZING pictures on SM124s that are
gray, but look as sharp as a photograph! They ought to! 600 x 400 should
yield fantastic quality...so, where is it?

3) Is there any source ftpable that has a collection, or even just
a few, of these images? What might they be called? What kind of suffixes
will they have? GR8? GR9?

4) Is it possible to get Gif images to look remotely nice on a STE?

Thanks in advance for any help that can be given...I just sorta jumped into
the world of the ST without really looking at what it can and cannot do..

Thanks,
Scott
.

2563. NeoDesk v3.0 Desk Pictures

Newsgroup: comp.sys.atari.st
Date: 1991-04-02 08:23:54 UTC
From: SAMcinty@exua.exeter.ac.uk
Message-ID: <1246@exua.exeter.ac.uk>
Source record: 233669

I've got a .pi3 file that I want to make my desktop on NeoDesk, but when I rename it to Neopic_H.pi3 (as the manual says to do) and restart, it reverses the black and white of the image....if I double click on the file it shows up as normal...but when it goes to the desktop it inverts....why?

How can I fix it, other than changing the b/w of my desktop, which I don't want to do.

Scott.

>board is for 14 pins, the drive connector is 34 pins. I rember reading some of
>the early single sided drives used an old kind of connector (guess what kind I
>got). If you know how to convert the plugs I would be very appreciative.

I recently upgraded a 520 STFM to a D/S drive. The 14-pin connector comes off
a small (aprox 3" by 3") pcb that is no longer required - unscrew the pcb and
you should find a 34-pin connector going into it. Disconnect the small pcb and
the free cable SHOULD now connect straight to your new drive. I had to twist
the cable through 90 degrees to get the right polarity, if you get it wrong
the drive light will stay on permanently but do no damage.
The pcb is no longer required and can be stored/junked with the SS drive.

This worked for me, I can't guarantee it will work for you. If your ST goes
into orbit when you switch on I'm real sorry but it's not my fault.

Greetings all....

I have once again encountered problems with my STe. It seems that my internal drive has decided that it doesn' want to work any more... It ucks, caue I dont have a harddrive, so I cant even boot up... Is there some known problem with the drives in the STe? It spins up on powerup, and when the boot process tries to read the drive it makes a buzzing sound and cant access it... Thi really sucks, since I opened the machine to put in memory.... Argghhh!

John

I know it is rude to post a followup to your own article, but I found out what the problem was. It seems that my internal drive was bad when I bought the machine, but worked. It got progressively worse, to a state where it was no longer usable. Well it was also the reason some of my disk's were getting trashed. I went back to my Local Dealer(I know, I am Lucky!) and he replaced the drive for me free of charge, even though I opened the machine to put in my Ram! Coolness...

John

2573. Monitors

Newsgroup: comp.sys.atari.st
Date: 1991-04-02 18:35:48 UTC
From: chuj@horton.colorado.edu
Message-ID: <1991Apr2.183548.5761@colorado.edu>
Source record: 233679

I was wondering if the Multi-Scan monitors are same as multisync.
Because there is a local store here with multi-scan SVGA monitors
1024x768 .28mm for only $380.00, It is a Samsung monitor. I have also
seen Panasync 1391 monitors as low as $329.00 WOW. This is not a miss
type price since I thought it was, but it's not.
The computer prices around Denver Colorado has been very low, I guess
it is due to the low sales, 486 systems are as low as 1800.00 here.
Can someone please tell me what the 486 systems and TT are going for
elsewhere?
I been deciding on getting a TT system, but since the prices are falling
around here, perhaps I should wait. I already have 486 system, but still
like to have a TT.

Thanks,
Jeff

2574. For Sale: Monochrom 1040ST System + Midi Software

Newsgroup: comp.sys.atari.st
Date: 1991-04-02 18:50:28 UTC

Message-ID: <1991Apr2.185028.21269@ux1.cso.uiuc.edu>
Source record: 233680
Cross-posted to: comp.sys.atari.st,rec.music.synth

```
For Sale:

Atari 1040ST Monochrome System (CPU, Drive and Monitor)
w/ the following Software:

1. EditTrack 5.0 from Hybrid Arts
-- Midi Sequencer and Manuals

2. GenEdit 1.1 from Hybrid Arts
-- Universal Patch Editor/Librarian
Complete w/ templates and new patches
for virtually every synth or drum machine

3. CRICIT 1.0 from Nice & Software
-- Integrated Cash Register & Inventory Control
Great for any small business...can print and
read barcode labels, create purchase order,
and much more.

Plus some twenty disks of games, word-processors, cad software,
c compiler, pascal, tele-communications software, and other stuff.

Also a few books on the ST, 68000 Assembly Language, etc., and all
original documentation.

All equipment is in good condition and perfect working order.
==> $600 takes it all, excluding shipping.

Will consider separate offers for the software listed but I won't
sell the computer without the software!

Direct all inquiries to:

Read what I just said: OTHER ST'S! i.e. "REGULAR" ST'S! That was the
whole POINT. And YES the ST's port is bi-directional; we use it all the time
internally to allow our debugger to talk to remote machines.

The DeskJet 500 has the same problem. I installed a _diode_ per the instructions that someone had posted on GEnie. The diode works just fine on the DeskJet and will probably work just fine on the LaserJet IIp, IMHO.

Well, I ordered a copy of Archipelagos from them and they shipped it promptly. It wasn't as fancy as the original copy of Archipelagos I had (this one had a box, a disk, and a folded sheet of paper with instructions, such as they were, while my other copy had a mulitpage stapled manual) but it had everything you needed (and at about 1/4 the price I paid at my local dealer for my first copy).

Based on my one experience, I'd order from them again...

Don Allison
don@col.hp.com

And now for my (slightly related) question:

Has anyone had any luck getting Archipelagos to work at all? After I bought my copy from the local dealer, I broke my ST trying to upgrade the memory and by the time I got it working again and got around to trying Archipelagos, my dealer had cleaned out the bank and split town, leaving his financier holding the bag...so when I found it wouldn't boot, I was stuck. I ordered a new copy from Sideline, and it has the same behaviour...can't copy it, can't boot with it, etc....is this a program that broke on upgrading to TOS 1.4? Is something flakey in my machine? Or by some remarkable coincidence did I just get two bad copies of the same program? (I'm going to call Sideline and ask for their help, but I thought since the subject came up here, I'd ask here as well).

2579. FTP Beginner's Guide

Newsgroup: comp.sys.atari.st
Date: 1991-04-02 20:35:29 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Apr2.203529.9330@terminator.cc.umich.edu>
Source record: 233685

This is a basic guide to ftp. It is intended only to get you on your
way to ftp happiness. Please let me know if you have any comments,
questions, or suggestions.

weiner@atari.archive.umich.edu

~~~~~~
Jeff Weiner's FTP Basics Vol.1 #1

Part 1: Logging in
To begin an ftp session, the first thing you need to do is log in to our
machine. You can do this by issuing the 'ftp atari.archive.umich.edu'
command. You should then see something like this:

Connected to atari.archive.umich.edu.
220 atari.archive.umich.edu FTP server (Version 4.169 Wed Jan 2 17:03:56 EST 199
1) ready.
Name (yourhost.domain.edu:yourusername):

At this prompt you'll want to type 'anonymous'. On some hosts, the word
'guest' will work, but 'anonymous' is always a sure bet.

If you don't see this login prompt, but instead get something like
'Our host was unable to trace a name back to (some internet address).
We only accept ftp from properly registered hosts', then you'll have to
ask your sys-admin to properly register your machine in its name servers.
There's nothing we can do on this end, so please don't bother asking.
Also, if your machine doesn't allow you to specify the atari.archive name,
try using out internet address : 141.211.164.8 Then, march down to
your sys-admins office and ask him to install name-service. Your life will
become much easier.

Assuming you recieved the above prompt, you'll then be asked for a
password. Use your mail address. For example, I would use
'weiner@atari.archive.umich.edu'

Part 2: Basic Commands
Once you're logged on, there's a few basic commands you'll want to know about.

ls : lists the names of files of sub-directories in a directory.
ls -C : Lists the files horizontally, instead of vertically.
dir : does the same thing as ls, but is needed on some other machines
ls -l : A verbose listing of files. Includes permissions, filesize, etc.
cd : changes directories (i.e. 'cd atari' would put you in the atari area)
cd .. : Goes 'back up' a directory, to the one you came from.

These are about all you need to get moving around the archive.
~~~~~~

Part 3: Getting the Goddies

The main reason you want to ftp in the first place is to quickly transfer files. More often than not, you'll want to transfer the files from the archive to your account. You can do this using the following commands:

First, find the file you want to download.
Second, issue the command 'type binary'. This tells our machine that you'll be transferring a binary file. This is really important. You'll waste a LOT of time if you download files that were not transferred in binary mode.
Third, issue this command 'get <filename.ext>'. This will instruct the archive host to send <filename.ext> to your account.

The last thing you'll want to do is use the 'quit' command. This tells our machine you're no longer interested in ftping files, and would like to go back to your command prompt.

Now, you'll need to download your files from your mainframe(sparc, whatever) to your ST. Usually you'll want to use either kermit or x- or y- or z-modem protocals. They're very reliable. I'd be quite hesitant to try something else. Also, your machine and ST are usually unique to you. This means that I really can't help you with this part. You could try asking, but I'm going to promise anything.

Part 4: A Few Words on Net Ettiquette

Net Ettiquette is something that every net user should be aware of. Relating to ftp, and our archive, it is essentially this:

1) Try to keep ftp usage to an absolute minimum during business hours, in our time zone. That would be 9 am to 5 pm , EST. This roughly means upload or download one file or so and little else during these hours. After 5pm, have a blast. Go nuts. We probably won't mind nearly as much..... Otherwise, we will drive to your campus or place of work (even if you live in Europe) and we'll kick youe butt. Or, Jon will sing Prince songs to you. Whichever you'd like the least.

2) If you have a question about some aspect of ftp service or some other area of your computer, please ask around at your site first. Don't immediately fire off all of your questions to us. I don't mind answering questions about the archive, problems with logging in, or something similar. But I tend to get upset when people ask me questions like, "Jeff, how come I can't get the fgrep command to work properly on my sparc station...."

3) Please try to upload files that you know the archive doesn't have. I know it's not the greatest thing to do, but if you can find time to download stuff, I think you can find time to return the favor and upload things also.

If you have any reasonable questions, any comments or concerns, etc. please mail them to me, weiner@atari.archive.umich.edu.

Thanks,
weiner

2580. Uploading to atari.archive and posting to c.{b,s}.a.st

Newsgroup: comp.sys.atari.st
Date: 1991-04-02 20:36:55 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Apr2.203655.9419@terminator.cc.umich.edu>
Source record: 233686

```
Uploading to Atari.archive.umich.edu
and
Posting to comp.{binaries,sources}.atari.st
By Jeff Weiner, Atari.archive Guardian

How to upload to atari.archive.umich.edu:

There are two main ways to upload to the archive: FTP or mail

1: FTP - This is the preferred method, as it doesn't clog my mailbox with
megs and megs of stuff, not to mention it's a bit easier for you too.
Logon to the archive as usual, then issue the following commands

cd ~atari/new
type binary
put filename.ext
mail weiner@atari.archive.umich.edu .... "Hey Jeff, I just uploaded this..."

This last step is very important. As we're now integrating the
index with text and the ls -lR listing, descriptions and an address to
send questions to are key.

Ed Krimen, ekrimen@ecst.csuchico.edu, adds this:

For those that may not know, may I add that, for aesthetic effects,
if you enter "hash," before you "put filename.ext" or "get
filename.ext," the ftp program will display a # for every 1024 bytes
sent or received. Actually, when you 'put' a file, it will display
bunch of # at once. Moreover, if you enter "bell," it will sound your
system bell when a function has completed. Finally, you can send and
receive a list of files using the "mput" and "mget" commands,
respectively, with a list of the files after the command.

2: MAIL - This is a bit slower for you and for me, but is still very effective.
Simply uuencode the file, (please split it into parts ~=40 M or less please)
and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpfull as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled file transmission, containing a short description of
the file, etc. Shar files are also acceptable, but I prefer the uuencoded.

And for those of you who would like to see your binaries and sources appear
in comp.{binaries,sources}.atari.st, the following is taken from Steve
Grimm's Introduction to Binaries and Sources:

Subject: Submitting binaries for publication
```

Items intended for posting or queries and problem notes should be sent to atari-binaries@panarthea.ebay.sun.com. If you are on a UUCP-only site, you can send them to {backbone}!sun!ebay!panarthea!atari-binaries.

If you're in Europe, you can send binaries to the European submoderator, Jan-Hinrich Fessel, at unido!atari-binaries (or, if you're a masochist, atari-binaries@unido.informatik.uni-dortmund.de.) He will test them and forward them to me. Submitting to him saves net bandwidth, so it's encouraged.

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while.

Also, as of volume 8, I will only accept binaries packed with an archiver for which source code is widely available. For the time being, this pretty much means arc, zoo, and lharc. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to atari-sources@panarthea.ebay.sun.com. If you are on a UUCP-only site, you can send them to sun!ebay!panarthea!atari-sources. In Europe, send your submissions to Jan-Hinrich Fessel, the European submoderator of the group, at unido!atari-sources (or, if you're a masochist, atari-sources@unido.informatik.uni-dortmund.de.)

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it

for a couple of days. Please note that, except in rare cases, source without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a pain to separate them, and such submissions are invariably placed on the back burner. Sources should be submitted in the same format as binaries -- uuencoded arc, zoo, or lzh files. Please use Pierre Dumas' "uue" program if possible, as it can correct some common transmission errors. Split long submissions up into reasonable (less than 50K) chunks. "uue" will do this for you, if you use "uue -700 file" to encode.

Please inform me of any special system requirements, and what development environment was used, so that I can properly test your submission and label it when I post it.

2581. NoiseTracker v1.5

Newsgroup: comp.sys.atari.st
Date: 1991-04-02 20:46:05 UTC
From: robotron@tardis.computer-science.edinburgh.ac.uk
Message-ID: <9104022049.AA02538@ucbvax.Berkeley.EDU>
Source record: 233687

I checked the April edition of ST Format and saw that NoiseTracker was
advertised by various PD Software companies:
p83 MT Software
p119 Public Dominator
p126 Demo Club ("Noisetracker V1.5 - The latest version with English docs")
p128 LAPD
p130 Wizard PD

Nobody was charging more than #2.50 for it ($5).

Unlike Audio Sculpture, it allows you to save modules. It also works
perfectly on a 520 - I haven't yet come across a module too big to load.
So, I presume it will soon be verified and available from atari.archive as
noiztrkr.lzh, either in atari/music/ or atari/sound/players. (Note that
Audio Sculpture has been moved from atari/graphics to the latter directory.)

From: wright@hpcc01.HP.COM
Message-ID: <1540013@hpcc01.HP.COM>
Source record: 233689

Well, I was able to obtain enough information from Hybrid Arts to convince me to place an order for "EditTrack Gold." This product is the successor to EditTrack II, and will be shipping at the end of this week (if you believe software companies:-).

This product does not sound at all like the typical crippled entry level sequencer (e.g., 60 track limit vs. 12 in Tiger Cub). As far as I can tell, the only thing that it lacks from the top end "SMPTE Track" sequencer is the SMPTE support. And the price is right -- $99 list, $75 when purchased direct from Hybrid Arts.

2584. Atari 1040STE with 4 meg RAM and software FOR SALE

Newsgroup: comp.sys.atari.st
Date: 1991-04-02 21:50:28 UTC
From: Steven.Kennedy@samba.acs.unc.edu
Message-ID: <3198@beguine.UUCP>
Source record: 233690
Cross-posted to: misc.forsale.computers,misc.forsale,comp.sys.atari.st,triangle.forsale

Atari 1040STE with 4 meg RAM forsale, (720K DS/DD internal drive).
We are selling our complete Atari system. We have a brand new 1040STE
that we no longer need. It has a authorized service upgrade to 4 megs
RAM (old SIMS are still available too, for those wanting to upgrade
an existing system). In addition to the base computer, we have a second
double sided drive for sale. We also have two monitors, one SC1224 that is
only about 1 year old, and one SM124 that is brand new. For those of you
who don't know the those model numbers, the first is color, the second is
monochrome for high resolution graphics and clearer text readout.

As those of you out there who cherish Atari's know, this is a very powerful
computer, with great application for MIDI work as well as desktop publishing
and quality word processing output. In addition, we have several productivity
programs for sale as well, including VIP Professional (just like LOTUS 123),
the financial cookbook (for calculating mortgage costs, loan payments, and lots
of other useful stuff), PageStream, Word Perfect, Microsoft Write, Phasar,
Printmaster Plus, and various games. See below for prices.

HARDWARE: Brand New Atari STE with 4 meg RAM $550.00 Or Best Offer
2nd DS/DD Atari floppy drive $100.00 "
Brand New Atari Monochrome Monitor $140.00 "
One-Year Old Atari Color Monitor $250.00 "

SOFTWARE: Wordperfect (great word-processor) $100.00 "
PageStream (desktop publisher) $100.00 "
Phasar v3.0 $30.00 "
VIP Professional (spreadsheet, etc) $30.00 "
Microsoft Write $25.00 "
Printmaster Plus (for posters) $20.00 "
Financial Cookbook $20.00 "
Various Games for all $50.00 "

IF YOU WANT THE WHOLE SYSTEM ------------$1335.00 Or Best Offer

JUST REMEMBER , YOU CAN MAKE US ANY OFFER YOU WANT. IF ITS REASONABLE, WE
WILL CONSIDER IT FAVORABLY.

The entire system is in excellent condition, and as stated above, most of it
is brand new. I'd prefer to sell the whole thing to one person, but I will
break it up if necessary, so don't hesitate to call for just one piece.

If you interested, which you should be, please either call Steve Kennedy
at (919) 479-7066 or get me e-mail at Steven.Kennedy@samba.acs.unc.edu
I'd prefer to be called at home, as I don't get to check my e-mail but
once a day. There is a machine at my home number , so please leave a

message.

Source record: 233691

Hmm, this is a toughie. Think I got the problem though, and mebbe the solution...

Sounds like the word processor doesn't like IBM disks. It's probably programmed to test the disk more than the Atari desktop (GEM) does. So, save the file (as ASCII text, if you can) on an Atari disk. Quit the word processor, and copy the file from the Atari disk to the IBM disk FROM THE DESKTOP.

Caveat: sometimes the Atari doesn't like IBM disks due to an obscure thing called the "disk serial number", something which Ataris write to disks but IBMs don't... if the Atari sees two disks with the same serial number, it screws up *BAD* (thinks they're the same disk.) If the procedure I previously listed doesn't work, try copying the file to a RAMdisk or a hard drive (if your friend has one) first and then to the IBM disk. I hate GEM file copy anyway, you hafta swap disks umpteen times and it's slooooooow.

BTW, I'm a "starving artist" writer myself.

Date: 1991-04-02 22:29:30 UTC
From: todd@NISC.SRI.COM
Message-ID: <28735@fs2.NISC.SRI.COM>
Source record: 233692

It is too easy. I also have an old 1040ST. Not only is there no modulator board, but the composite output line that's supposed to come out the connector doesn't exist. On later models it was added. We're screwed. My info comes both from the Atari ST Internals book and I asked at an atari shop just the other week about this. Oh well.

2587. Re: Please outline requirements for UUCP transfers to ST

Newsgroup: comp.sys.atari.st

From: steve@thelake.mn.org
Message-ID: <A2283411074@thelake.mn.org>
Source record: 233693

[In article <1991Apr2.031644.4995@menudo.uh.edu>,
rcte2p@menudo.uh.edu (Paul Stephen Sears) writes ...]

> Can someone provide a clear outline of what exactly is required to
> establish UUCP transfers of mail and news from a site to my ST at home?

1. You need a news/mail feed. Start by making your college system
administrator your friend. If that doesn't work, look in comp.mail.maps
for your state's UUCP maps and try contacting sites named therein. If
you still come up dry, contact postmaster@psi.com and/or uunet@uunet.uu.net
and be prepared to pay for service.

2. You need software.

> Please provide locations of software also if possible.

atari.archive.umich.edu (PD/Shareware), Beckemeyer Development Tools
(commercial). The Michigan archive should have at least two or three
versions of UUCP. Beckemeyer's UUCP is fairly cheap and will multitask
under Micro RTX/MT C Shell.

> Can this be done
> using only PD software?

Yes. See Rodney's Mercury UUCP modules, STadel BBS, UUPC (not
recommended), Mailtruk (written in GFA BASIC), etc. I know of two or three
others that are in operation but not released (including the s/w run here
at thelake).

I'm also beta-testing a new UUCP package from the author of a BBS system;
details will surely be made public at a later date.

> How do you register your address? With whom do
> you register????

To get your site registered in the UUCP Zone maps, contact your region's
map coordinator. If you do not know your region's map coordinator, contact
the UUCP Project at one of the following addresses:

domain-request@uunet.uu.net
{vucomp,halla,pyramid,rutgers,uiucuxc,rosevax}!uunet!domain-request

If you cannot send electronic mail, telephone
+1 703 764 9789

UUCP sites can obtain Internet-style, fully qualified domain addresses.
The preferred method for freestanding, small sites in the United States is
to register with the US domain. For details, contact westine@isi.edu or

get information by sending mail to service@nic.ddn.mil with a Subject:
line of NETINFO US-DOMAIN.TXT.

2590. MAC Printer Driver for OKIDATA 292/IBM Graphics?

Newsgroup: comp.sys.atari.st
Date: 1991-04-02 23:38:57 UTC
From: kron@netcom.COM
Message-ID: <1991Apr2.233857.18872@netcom.COM>
Source record: 233696
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've tried all of the vendors in the GCR Manual and none of them do the OKI 292 and local vendors. Any ideas?

Grappler says they are not compatible with any Atari/Amiga emulators. Has anyone tried them?

Printworks phone is no longer in service and

GDT Sofworks doesn't support the 292 (only 300 and up).

BTW -- I have a printworks printer driver for sale (originally $75) will take best offer.

It's an optimization. Remember, word-length values loaded into address registers are automatically sign-extended, so you can store addresses 0000-7fff and ffff8000-ffffffff in only 16 bits. This saves 2 bytes and a couple cycles every time you reference those addresses. It is also completely legal/correct.

>00ff8e20 -> ffff8e20???

Dunno, maybe to try to take advantage of the above optimization. It's also perfectly legal. In fact most of my docs list the hardware register addresses as ffffxxxx, not 00ffxxxx. Can't think why you'd want to use 4 bytes to store a value when you only need 2, and using 4 slows you down...
>
>I had this occur when I was working on my app program..MOST ANNOYING.

Nothing to fret about whatsoever...
>

I'm afraid it won't be as easy as you've said it. Most graphics cards need
to be connected to the internal connector of the Mega ST (so-called 'Mega-bus')
and 520 and 1040 do not have this connector. You'll need to build this
connector yourself...

There is no usual method, GIF is not an ST standard picture format. It is
a (*gag*) PC oriented format designed by the Software Geniuses at
Compu$erve. (double-*gag*...)

>2) Does the STE have gray scales, you know, proper shades of gray, not
>just the nearness of black and white pixels? How can I use these scales?
>When I look in magazines I see some AMAZING pictures on SM124s that are
>gray, but look as sharp as a photograph! They ought to! 600 x 400 should
>yield fantastic quality...so, where is it?

"Gray-scales" on the STe typically refers to using a color monitor on the
STe and just filling the palette (16 entries) with gray. On the STe since
there are 4 bits per color (R,G,B) and "gray" is just equal values of each
color, you can get 16 distinct intensities of gray *on a color monitor* and
only in low-rez. In medium rez you can only get 4 levels. There's nothing
special going on here, you're just using your color system with a pretty
unimaginative selection of colors.

>3) Is there any source ftpable that has a collection, or even just
>a few, of these images? What might they be called? What kind of suffixes
>will they have? GR8? GR9?

Try .SPC, .SPU, or .SPS for Spectrum 512 pictures. Spectrum 512 only uses
low-rez as well.

>4) Is it possible to get Gif images to look remotely nice on a STE?

Well, it's fairly simple to display a full 256-color GIF image, if that's
what you mean. I have code doing this in my port of Fractint 12. Using
frame-swapping to (almost) double the number of bits per pixel just about
squares the number of colors to choose from, and also squares the number
of colors displayable at once. (Fractint lets you use 16 colors in med-rez
and 256 in low-rez.) This is pretty reasonable, given that regular VGA
rez only allows 16 colors onscreen in 640x480 mode. I wonder why other
folks haven't tried these tricks with their GIF decoders. I am taking the
GIF decoding routine from Fractint and using it with my frame-swapping
code, and getting pretty tolerable results.

For you with your monochrome system, well... Frame-swapping can work there too, but I'm not sure how many colors you can reasonably expect to get. I just received some code from someone else that is supposed to render 256 grayscales on a monochrome monitor, I haven't gotten to try it yet. (Looking thru, it seems to really only give 4 or 16, but that's still better than black&white, eh?)

Get a copy of GIFFER for the ST for converting GIF files to the ST with a
monochrome monitor. It has 4 levels of dithering. GIFFER won't let you save
the files into a PI3 pic, so you'll need a screen capture program, SNAP30
works well (I think it's SNAP30). Both programs are on atari.archive.

>crap.

The secret to photo quality pictures is (for black and white) the number of brightness levels (greys) or (for colour) the number of RGB combinations available per pixel.

Consider that USA broadcast television can only send about 250 equivalent color "pixels" per scan line, and you can see that the issue is not one of the number of pixels per line (of course, more don't hurt) but of the "shades" those pixels can assume.

A GIF on a 640 VGA is BETTER quality than anything I've seen on my broadcast television set. An Atari ST or STe is much worse. Not because of the number of pixels in a scan line (which exceeds broadcast TV) but simply because the Atari has only a few shades to pick from in color mode (4 or 16) and only black and white for high-res mode.

You see, VGA has 256 colors (or 64 shades of grey, I believe) per pixel. There in lies the secret, and there in lies the disappointment of Atari's stone age graphics modes.

>4) Is it possible to get Gif images to look remotely nice on a STE?

No. Even ST's in color mode have only 8 shades of grey, and the STe's have only 16. In high-res mode you just got on or off.

I take it by frame swapping that you build two (or more) logical screens
and alternate between them every vertical retrace -- so as to layer
intensities on top of one another. Thus your eye and the persistence
of the phosphors become the brightness integrators. A duty cycle kind
of thing. Let's see per color you have one frame-pixel full on and
one frame-pixel in one of 8 possible levels. Or one at level 6 and
the other in 7 possible levels, etc .. 8+7+6+5+4+3+2+1=36 levels per
color, or 46,656 possible colors to choose from.

Hmm, but you still only have 16 pallette cells to choose from per
scan line, and you can only add them and not multiply them. Giving you
32 colors per scan line (or scan zone in Spectrum 512 mode) max.

My guess would be that flicker and pseudo-shadow movements would be
quite severe. So how does it really look?

I must disagree -- assuming by 'remotely nice' we mean as good as VGA. One may convert GIFs to Spectrum 512 format. Perhaps the best utility for converting them is DIGISPEC, a commercial desk accessory. There are other GIF conversion programs for the ST, but some will not do Spectrum 512 format, and others won't convert to Spectrum 512 as well as Digispec.

I think a good comparison is the CLOWN pic: it looks good in VGA, and as good or better in Spec512 format on an ST, IMHO.

I agree with John though, in that, if you want a GIF converted to the standard low-res's 16 colors (DEGAS or NEOchrome pic), then it's usually not worth the effort.

Why not try RUFUS, it is in German and is Shareware,
has all the things that you would wan't,
here is a small list.
1. X,Y,Y-G,Z, and Stream
2. Auto Zmodem Dnloads.
3. Background Transfers, (Not Zmodem)
4. VT100/52
5. Batch/Script Mode
6. Group Dialing, also has a limit of 16 Phone No.s
7. Has support of 6 screen sizes
8. Fonts and Screen sizes selectable
9. Works in all resolutions

Get a copy and have a Play with it, it is on Genie...

I ordered Anarchy and Shoot 'em up Construction Kit about three to four weeks ago at their 14.95 price. The only problem I had was they accidently shipped it COD when I'd asked for credit card purchase... I called to make sure I wouldn't be charged for both, they said that there might have been some problem with card #, etc and to call if my card was charged. I got my credit card bill the other day and they didn't charge my card. Response time was fairly quick, about 1.5wks from FLA->CO.

The worst thing, though, was that their specials go quick! I had a list of about 6 arcade games from their 14.95 specials I'd been wanting for a while and Anarchy was the only one they had left... (If anyone has a used Black Tiger or Strider for sale let me know!)

> Notes and really liked the prices. Really liked their prices, really, really

> Does this company actually exist and do they actually sell what they
> advetise at what they advertise (14.95 for a game that everyone else has for
> about $32.95 or more).

I'm not sure how they get prices like that... When I visit my family in Columbus, Ohio I go to the local(!) atari/amiga/ibm shop. They buy/sell/trade and have great prices on used STuff (carry UK ST mags too). The scary thing is (and here comes my point) they have some kind of shrink-wrap capability because they can shrink-wrap the used stuff. Although it is marked, they could easily represent used software as new. I'm not saying Sideline does this, but it is one way to get good prices.

Here're examples from the used 'deals' I got last visit to the shop in Columbus: $10 Drakkhen, $6 Battletech, $4 Iron Lord.

The volume of business this store does is amazing. The Atari/Amiga markets in central OH must be thriving.

Hello,

I am trying to use the emacs-editor on my atari 1040 st. I have a gnu emacs distribution (version 18.51 I think) from the mailserver in Utrecht. I set the environment variable $EMACSLOADPATH with the program environ.prg. However, emacs complaines that it cannot find its files, because the path is still the old path. Did I do something wrong, and if so, what?

I saw a story on the Reuter business newswire that said Atari Corp. is
negotiating with Israel to establish a $150 million computer factory.
Israel is being asked to supply $100 million or so in loan guarantees
for Israeli component plants. Apparently if Atari assembles machines in
Israel using a sufficient level of Israeli-made components, the machines
can be shipped duty-free to the European Community. The production
capacity would replace plants currently operating in Taiwan.

Source record: 233516

It seemed reasonable to point out here that VGA uses a minimum of (I hope I have this right) 256 K of screen memory. I'm rather nearer to certain that most super VGA uses a Meg. This isn't the sort of thing that would have been considered reasonable when the ST was designed.

Making the display system independent (ala PC) has the advantage of allowing you to make improvements when technology changes. It has the disadvantage of causing proliferation of semi-compatible 'standards'. (Look at the distribution kit of any high-end PC application. There are many screen drivers.)
Steve

Strictly speaking that would be multi-processing, not multi-tasking...minor
difference. Multitasking is where the CPU must divided its time between the
programs running (ala Amiga), while multiprocessing allows programs to run at
the same time (ala Atari Transputer, or similar device).

>wrong(or better yet, how do I do it right!) Thanks in advance

It could be that you are losing bits during transfer, either from terminator
to bgsuvax, or from bgsuvax to your atari.

Or it could be "uncompress" for the ST. I believe that some
"uncompress" releases for the ST did not have the same capability
as compress on the vax. In either case, this sequence might solve
your problem. Try this:

(1) trasfer your ".Z" file from terminator to bgsuvax
dont forget to use binary mode.
(2) use uncompress on bgsu to get the uncompressed file.
(3) use UUE or uuencode on bgsu to get a mailable "text" file.
(4) transfer the text file to your ST
(5) use UUD on your ST to decode and get the sound files.

Good luck.

2618. DigiComposer (was: Re: NoiseTracker v1.5)

Newsgroup: comp.sys.atari.st
Date: 1991-04-03 17:56:22 UTC
From: daniel@hexagon.se
Message-ID: <3314@hexagon.se>
Source record: 233524

I have recently came across a new PD soundtracker from Sweden, called "Digi Composer". It is supposed to be ProTracker (Amiga) compatible, and it makes use of the STe PCM soundchip as well as stereo output (even on a normal ST w/ some kind of DA converter). It supports OverScan which is very nice when editing.

ALSO NOTE: It is TT compatible and timer driven. No more 50/60 Hz problems!

If someone would like to upload this to atari.archive, I will be happy to send you a disk. I don't have ftp access myself.

[In your article, you wrote:]
)Unlike Audio Sculpture, it [NT 1.5 -dd] allows you to save modules.

I don't know if you knew this, but the version of A.S. on atari.archive is only a demo of a commersial product. Of course that version will allow you to save modules as well. A.S. has far better sound quality than any other soundtracker on the ST I know of, and it can play a lot of modules NT and DC will start bombing on.

2619. Connecting an RGB monitor to a 1040STE

Newsgroup: comp.sys.atari.st
Date: 1991-04-03 17:56:47 UTC
From: malay@sae.com
Message-ID: <247@jupiter.sae.com>
Source record: 233525

I'm posting this again, our news processor went haywire and we didn't receive
any messages for two weeks.

----------original message----------
Help! How can I connect a Zenith Data Systems ZVM-135 RGB Monitor to an
Atari 1040STE? Here's the ZVM-135's connector pinout:

1 - Negative horizontal or negative composite sync*
2 - Positive horizontal or positive composite sync*
3 - NC
4 - Positive vertical or positive composite sync
5 - Green input
6 - Blue input
7 - Red input
8 - NC
9 - NC
10 - Green feedthrough
11 - Apple X1 Input
12 - Apple X2 Input
13 - Apple X3 Input
14 - Negative vertical or negative composite sync
15 - IBM intensity
16 - Ground
17 - NC
18 - Audio input
19 - Ground
20 - Composite video input
21 - Red feedthrough
22 - Blue feedthrough
23 - NC
24 - NC
25 - Apple X8 input

*NOTE: Composite sync must be supplied to both the horizontal and vertical
sync inputs.

Specifications:

inputs ..... DB-25 type connector
R,G, and B signals TTL level analog positive
Composite - TTL positive or negative
Horiz sync - TTL positive or negative
Vert sync - TTL positive or negative
Ground
Audio - .5V to 1V rms.
Audio ground.

Apple III video - (4)
IBM intensity
Composite video.

This monitor is switchable from RGB to Composite. It has an DB-25 RGB connector and a set of RCA phono type jacks for composite. There was a message floating around (dated 4 Jan 87) that showed how to connect a Sony XBR monitor to an ST and it works (I've seen the result). I realize that I could just use the composite input with the STE but I would like to use the RGB for obvious reasons. Anybody got any clues????

trh@atari.UUCP (T R Hall) writes:

> Actually, the way the Glue chip "Bus Errors" is that it has a
>(minimal) timer that watches /AS. If /AS is longer than 1uS (1000nS) than
>it generates a /BERR.

Using the /AS to generate the BERR?? What a great hack!!! Even motorola don't
mention that it can be done that simple - instead they say (quote) :
"BUS ERROR AND HALT OPERATION
...
External circitry must be used to determine
the durtion between address strobe and data
transfer acknowledge before issuing a bus
error signal..."

/AS and /DTACK is coupled very closely... (great hack)

There is one thing that worries me though - 1uS timeout??? From what
I can see in the motorla docs. then a Read-Modify-Write Cycle have
the /AS low for 8.5 cycles (at 8Mhz this is sligthly longer than 1uS??)
Don't you mean something like 64 cycles (or 8uS???).
One thing is sure - the read-modify-write instruction TAS, don't trigger
a bus-error (it's used to check if the blitter is ready).

> [I probably shouldn't say this part, but what the heck...]
(Please do...)

> For those who really want to kludge, you could even respond to
>accesses that are in spaces the Glue decodes, but doesn't respond to, such as
>WRITES to ROM spaces. Of course, you can't READ what you wrote (because of ROM
>responses to read), but the writing part of the kludge would work.

Kind of WOM (write only memory), it's very cheep to manufacture - there is
one problem though (it's kind of hard to get the information back out) ;-)

Even better than generating a /DTACK on internal ROM, is generating it
on the ROM port - remember to put the R/W signal through a hole in the box...

Keep up the good work, TRH - and let us know all the details...

This is the first News article I have ever posted, so criticize if
I did something wrong and encourage if I done OK.
I called GDT Softworks this week and was told that the NX1000 printer
was NOT supported by them. The salesman told me that the printer was
listed, but listed as unsupported! I thought the NX1000 was Epson FX
compatible and told him so. He said, "Don't talk to me about it."
Has anyone out there got a Spectre GCR and a NX1000 working?
If so, where did you get your driver?
Also, I have an old C.Itoh ProWriter in the closet, and if I must
I could dust it off and hook it up, but I was really looking forward to
selling it at my next garage sale.

You might be right there...

> To exorcise one may
> 1) Replace expressions like ++i; if(i == ANYPOWEROFTWO) i= 0;
> by ++i &= (ANYPOWEROFTWO - 1)

????? in what language do you want to write that ?????

What you are writing is :
++i = ++i & (APO2-1);
- no matter how you try to hide it...

But ok, I understand what you mean - what you want is a interlocked add cyclic.
IAC 1,APO2,i - but no compiler can generate that to a 68K. Some
signal processors can (and they are not restricted to powers of 2 (Analog
Devices).

> 2) make sure the interrupts are disabled whenever forkq() is called
> (from chkkbd(), mchange() and ap_tplay())
```

This is a lot easier than making a new CPU with new instructions and a new
C-like compiler that can generate them...

> 3) recompile, assemble and link the system.

might be hard to do with '1)'...

2626. Floppy drive trouble

Newsgroup: comp.sys.atari.st
Date: 1991-04-03 18:59:01 UTC
From: yonder@netcom.COM
Message-ID: <1991Apr3.185901.12568@netcom.COM>
Source record: 233532

Recently my internal DS drive in my 1040STf stopped working correctly..
I managed to waste several disks before I realized it was going, uhg..

I thought for sure it was the drive mech that had gone bad, so I got another
one (actually a TEAC model, that a friend of mine had successfully used to
upgrade his SS drive). Anyways, it still wouldn't work.. My hard-drive
still works fine though.. So currently my bet is on the floppy controller
chip (WD1772) or possible the buffer chip (U8 a 7406).. Anybody else
out there think diffrently? I cannot get a drive to read or write or format.
It will attempt to do all three but always fail miserably! My computer fails
with three diffrenent mechs: my TEAC, my old Atari drive, or my friends
external TEAC-modified drive.. My friends (520ST) will work with any of the
drives.. (He swapped my old Atari mech. into his old SS drive case)..

Another realted deal: my floppy light on my 1040 has always flashed very
faintly while my hard-drive is on.. I seem to recall reading about his
before.. Is this good, bad, or just annoying? Is a fix available?

Well, any advice would be greatly appreciated, but it looks like solder sucker
time to me... :-(

2627. 1.44 Meg on ST...

Newsgroup: comp.sys.atari.st
Date: 1991-04-03 19:04:15 UTC
From: yonder@netcom.COM
Message-ID: <1991Apr3.190415.12928@netcom.COM>
Source record: 233533

This is related to the "bad floppy" message I posted..

Since I have a new 1.44M floppy mech, I was wondering were I can find
info on how to get it to work.. I seem to recall there was a modification
that had something to do with routing a faster clock to the floppy controller..
If it a different floppy controller chip is needed that is ok (if you read my
other message it looks like it is bad and will have to be replaced anyways).
Of course I will need a program to format 1.4M disks as well.. or at least
some specs on how to right my own.. And one last thing.. how about
compatibility problems (GCR?).... thanks... yonder@netcom.com

>So you really have less.

Far less! You get 15 non-redundant intensity levels by swapping
two frames. Thus giving you 3375 colors (a subset of which is
the 15 shades of grey) to choose from, but you still can only
pick from 32 pallette cells per scan line (or zone.)

Ok. It is. I never saw it before... Been on there since November.
Anyway, I am using it right now, but, one comlaint is that it is not a
speed demon :-). Uniterm is still one of the fastest fully vt100
compatible emulators out. I do like being able to change fonts in
Rufus. However, I don't know any German so I am lost on its features.

BTW, I saw that uniterm.tar.Z was dated April 3 (today!) - is this a new
version? or did someone just re-upload it?

(Anyone want to try to do a emulator in assembly and still keep it fully
vt100?)

Later!

gjh@hplb.hpl.hp.com (Graham Higgins) asks:

> Anyone know whether Spectre GCR handles the 1.44Mb floppy ugrade?

The Dream Park chip swap that replaces the WD1772 with another controller? No, not yet. Dave Small would have to make the drives slow back down to 300 RPMS. The hack published here by hase (Hartmut Semken)? I am not sure about it, but it might work, since the disk speed remains at 300 RPM. I wouldn't bet the farm on it though 8-).

In any case, Spectre GCR 3.0 doesn't support the high density mode, even if it could read GCR disks in such a system.

Hope this helps,

Bob Pegram {Awaiting his new STE, due to death of faithful 520}

Opto-mechanical means that a light beam passes through slits in a wheel that spins as the mouse moves, one horizontal, and one vertical. a light sensor on the other end senses the light pulses and converts these to movement info for the mouse controller. There is a rubber ball with little spikes all over it that is used to clean mice. Just place it in the chamber, and run the mouse around for as few seconds. It is for the mac, and I do not know if there is one with a bigger ball for the ST. A great idea, though.

In article <533@uqcspe.cs.uq.oz.au> warwick@cs.uq.oz.au writes:
>I've noticed MGR on atari.archive in the MiNT directory.
>
>What is it?
A window manager -- a program similar to X that allows you to run
different programs concurrently while showing the output of each
program in a separate window. You can interact with each program
by clicking in its window. You can 'iconify' a window so that it
gets out of your way and appears as a small icon on the screen.
MGR allows you to select a different font for each window containing
text. Each window has a mercifully small border that saves valuable
space on the screen (as opposed to GEM).

Thus, a typical scenario is that you'll have a clock running in a corner
of the display, you can be typing in an 80x25 shell window, have a download
going in an inverted white-on-black smaller window, etc...

>Do I need to be running MiNT to use it?
Yes, you need to be running MiNT for the multitasking support, and you'll
need to have more than 1 Meg of RAM to get started. To be comfortable, I
suppose maybe 3 Megs would do it, but I have been getting by with 2.
You'll also want a mono monitor, the bigger the better. Hard disk?
Yes, MGR comes with a lot of programs, font files, etc. It would
probably not be worth the trouble (or impossible) to use it off of
floppies.

Thanks to T R Hall for posting the solution to the 4 Meg memory limit
problem. We are going to need those 16 Megs, whether we get them in ST
memory or SST or TT memory.

>color, or 46,656 possible colors to choose from.

Hm. I don't quite follow this description. Ok, assume one frame-pixel full-on or full-off, =[0,7] (or [0,15] on the STe). Given equal display time per frame (two frames) this extends the ST palette to an effective 12 bits, or 4096 colors. (Or extends the STe from 4096 to 32768.) Pretty effective, and also surprisingly tolerable. I think this is what the Colorburst 3000 program did. But, this is somewhat wasteful, because this only uses 8 of the 16 available palette registers in the alternate frame. (3 colors, full on or full off, 2**3=8.)
>
>Hmm, but you still only have 16 pallette cells to choose from per
>scan line, and you can only add them and not multiply them. Giving you
>32 colors per scan line (or scan zone in Spectrum 512 mode) max.

Well, as I mentioned above, you're not realizing the full potential with the scheme you just outlined. Anyway, there are two alternatives, and I've used both in Fractint. First, and most obvious - unbalance the duty cycle. Use two alternating frames, but display one twice as often as the other. This immediately makes all your pixel bits in one frame "more significant" than the other frame. This gives you color levels of 0-7 on one frame, and 0-2-4-6-8-10-12-14 on the other. You now have 22 effective levels per color, or 10648 colors on an ST. (STe - 46 levels, 97336 total colors.) But I think that's a little extreme, it's also really just adding least-significant-bits, so all you're really doing is gaining finer steps between color levels. Oh, for the original poster, this means 22 and 46 gray-levels on ST and STe, respectively, on a color monitor.

Now, as to adding and not multiplying colors... Consider these two
palette definitions... (Let's use octal, for readability, eh?)

Palette 0: {000, 001, 002, 003, 004, 005, 006, 007,
020, 021, 022, 023, 024, 025, 026, 027}

Palette 1: {000, 100, 200, 300, 400, 500, 600, 700,
050, 150, 250, 350, 450, 550, 650, 750}

By inspection you should be able to satisfy yourself that using these
two palettes on two evenly alternating frames, you will be able to use
8 bits per pixel and get 256 unique colors. Your maximum intensity is
reduced to half of what it used to be, but the brightness control will
fix that. }-) I crippled the green driver arbitrarily, you could
decrease the red or blue resolution to suit your taste. This is what
you get on a PC with VGA, 3 bits for one color, 3 bits for another,
and 2 bits for the last. I don't recall what the 2-bit color on VGA is.
At any rate, it covers the full spectrum; there are no color gaps or
missing or overemphasized colors in this scheme.

[For med-rez, 16 colors, I used {000, 007, 020, 027}, {000, 700, 050, 750}.
Note that now two colors are 1-bit each, and one color is 2-bits.]

I posted a small archive several months ago (cbox.arc) that demonstrated
this setup when I first got Fractint running. It draws 16 horizontal bands
on one screen and 16 vertical on another, then just toggles in the two
palettes on vertical blank. If you don't have this demo, you can write
it yourself based on the description I gave. It will take me at least a
week to get to my stuff if I have to repost it, as I no longer have an
accessible online copy and I still haven't settled into a place yet, so
my STuff is still in storage.
>
>My guess would be that flicker and pseudo-shadow movements would be
>quite severe. So how does it really look?

Try it and see, eh? }-) The color scheme I chose above gives the
entire 256 color palette of the PC w/VGA. Try other setups....

Just the opposite of what USDOD indirectly did to Atari here: When Inmos set up their plant in Colorado springs to make transputers, which Atari would have bought to put into ATWs, DOD wouldn't let Inmos re-export T-400's and T-800's to UK, even though they were already being manufactured in UK!

From: mc4c+@andrew.cmu.edu
Message-ID: <UbyaIxC00UhBE0ynEu@andrew.cmu.edu>
Source record: 233548

You want constructive, TRH? Here it is.

You have power problems with external video? Well, since external video would most likely only be used at a station that has wall power, why not power the circuitry direct from the power line input. When there was not power line input, ie, when you are using battery power, the circuitry is off, and takes no power. Or the jack could act as a switch. When the plug was in, then power would go tho this circuitry, other wise it would not. This could work on either the monitor connection, thus allowing battery powered operation for those who want it, or on the power jack. When there is no external monitor connected, then it reverts back to the original machine., so you have the best of both worlds. Battery life and external video, or at least the choice.

The same thing can apply to the floppy. Put a switch on the drive that allows it to power on when there is a disk inserted. Have a capacitor set up so that on initial power on, it draws power from the capictors, thus avoiding a spike in the power coming from the battery sort of like an electronic fly-wheel. Also, while talking about floppy sensing, when the heck will Atari connect the drive sense line, so that the cpu REALLY knows when there is a disk inserted, and things like GCR can work porperly. It would be great if the desktop could automatically update windows when a new disk was inserted.
Back to the notebook, why not include the battery powered drive mentioned by TRH internally, and give an extra door on the bottom for the seperate battery power for the floppy, if one is going to use it. I prefer the above solution, but this is better than nothing.

As for the backlighting. No if's and's or but's. Not having a backlight is a fatal mistake. I do not care how great the contrast is. Will it be better than an active matrix display? Unless Atari has a new marvel in LCD technology, I doubt it. Why did Apple have to redisign the mac portable? Because of overwhelming complaints about the lack of a backlight. Even with the incredible contrast of the active matrix display on the mac, it was all but unusable in many conditions. Add a stage light? By the time one finishes adding on all the things one needs to use it, it will be just as huge as the STacy. Working in a lab with diffuse overhead flouresent lighting will work fine. But for a machine that is supposed to move around as much as a notebook, I do not think that you can rely on good lighting being available. Innovative power? How about this. Run a line from the hottest part of the circuit board up to the corner of the display, probably the coolest, and use the heat differential to create a current to power the backlight. I do not know if the power will be enough, but it is an idea, anyway.

I also agree with whoever it was that said that external pointer device support was essential. If I am and artist, I do not want to use an iso-point type device to draw, or is the noebook not for artists? If I am a musician, and am drawing waveforms for my dx-7 i do would rather use a mouse. Or is this not for musicians? Actually, a mouse is useful for just about everyone. I understand the space/power problems, but see above for potential solutions, or try this one on for size. The mouse connector could be modified to provide power TO the computer, and the mouse would have it's own batteries. The mouse would power its own controller, not the other way 'round. This could work on a redesigned (simple) monitor connection as well. Also, why not design it so that the LCD screen can open 180 degrees to the keyboard, and lock there, and can also lock into any other angle as well, and use the touchscreen device in the pad. Better for artist, musicians, and not that much more intrusive that taking your hands off the keyboard to use the iso-point like thingy. In fact I think it would be even better than the mouse, and since such an input device is supposedly already running on the ST Pad, the hardware is all but done. Add the handwriting recognition too, and WOW!!! While you are at it, let the LCD seperate from the CPU/Keyboard, and it would be incredible. You could set it up anywhere, just like a monitor. Even hang it on the wall in front of your desk! :^)
Yes, I am asking a lot, but am I asking too much? Think about it. These things are very small hacks, of a mechanical nature (the seperable locking LCD) and would be easy for any ID person. I will even do it! The locking mechanism would double for the release mechanism that lets the LCD separate. The cable coils into a slot in the cpu base. If great distance is wanted, a longer cable will have to be bought, of course. Third party people may even design an LCD connector To allow for this, both ends of the connector must terminate in a plug. There is a small easle, like on the back of a small picture frame, that allows the LCD to stand on its own. Thus, you have a "seperable keyboard" setup, just like the MEGA. Using a computer on your lap, even if it weighs next to nothing, makes porblems like carpal tunnel syndrom look like a small bruise. It is very difficult. The above set up alone would sell these things to PC and Mac people like hotcakes to the famished. This machine can be everything! And it would be a marketing dream if handled well. PC ditto in ROM!!!! Yeah!
[How about adding foot pedals so that we can skip the batteries and generate our own power :^)]

There are a lot of ideas that one can use to have one's cake, and eat a large portion of it as well. I just do not see why it is absolutely necessary to gut the machine to get more power. Why not try to get both a full function machine, and more power? Don't tell me it is impossible. When the mac notebook comes out, I'll prove you wrong! As it is, that beast of a machine gets up to twelve hours of power. A smaller more efficient machine.... We need to get the jump on the market, or else you may find that the market has gotten away.
Comments sugestions, post them wherever the hell you want. I'll read 'em, or I won't. Just like everyone else. Just quit a jumpin' down my throat, especially those who do not know about what they are speaking.

I love you all.

Peace,
-geisha-

>I must disagree -- assuming by 'remotely nice' we mean as good as
>VGA. One may convert GIFs to Spectrum 512 format. ...

Unfortunately, number of colors is only part of the story.. Spectrum 512, while allowing up to 512 colors on the screen, is still limited to low resolution... converting a VGA picture to 320 x 200 resolution usually results in severe loss of detail, and distortion of the aspect ratio of the original. (i.e., pictures come out fuzzy and squashed)

DigiSpec does a fairly good job of conversion, but allows no control over aspec ratio... picture of people come out short and fat usually.. the GIF converters that DO allow control over aspect ratio usually end up reducing the picture so much that an extreme amount of detail is lost..

The only GIFs that convert reasonably well to the ST are ones which were 320 x 200 to begin with... and there aren't very many of those any more..

>At any rate, it covers the full spectrum; there are no color gaps or
>missing or overemphasized colors in this scheme.

Are you sure this is how things are done on the VGA? I though that
VGA has a palette of 256 colors out of 32K total. In that case the
number of bits assigned to each color is really up to the programmer.
32K total colors is 15 bits which turns into 5 bits each of R, G, and
B. By appropriate palette choices a programmer could choose to have
5 bits of R and 3 bits of B represented in the byte allocated to each
pixel (if he/she so desires.) Because each palette lookup table entry
is independent I would think that it would be possible to use 2.67 bits
per color rather than the 3,3,2 method you describe. (I, of course, don't
mean that literally, but it should be possible to obtain a more even
distribution across the spectrum than is possible with the 3,3,2 method).
Then again, I don't know all that much about VGA graphics, so I may
be wrong about this.

Obviously, this relates to my previous posts.. I went out and headed over to JDR to pick up the floppy controller IC.. To my surprise they did not have it! So then I start calling around.. nobody has it -- "what part # did you say?".. All of the floppy controller IC's that JDR had are almost exclusively under $10 and the 1771 is $5.. Almost all of these IC's are 40 pin and I am sure more sophisticated than the 1772 (though I may be wrong, but why can't I run a 1.44M)? Anyways, I call up B&C and San Jose Computer, and sure they have it but it $25 (!!) at either shop.. So, my question is: is this the price I must pay, or is there an alternative? Hopefully, there is, but obviously I'll pay $25 if I have too.. I even went to the extent to call Western Digital (the IC manufacturer), they gave me the number of a local distributor, who informed me that it had be "obsoleted".. bummer..
Well, anybody got any advice (another Atari dealer with lower prices maybe?)

...in regards to loss of detail when displaying GIFS larger
than 320 x 200 :

Why not use the QuickGIF viewers available at atari.archive? There
are two viewers (B&W and Color). They are both very small .TTP
files, they're faster than other viewers I have seen, and you don't
lose much, if any, picture detail. They both create a virtual screen
that you can scroll around. They are still limited to 16 colors. To
get around the 8 greyscale handicap, the B&W viewer allows you to select
from one of 6 palettes that introduce the 8 shades of another color on
top of the 8 pure grey shades. While this introduces a false color into
the picture, the results are usually very good.

Just my $0.025 cents worth.

>>quite severe. So how does it really look?
>
>Try it and see, eh? }-) The color scheme I chose above gives the
>entire 256 color palette of the PC w/VGA. Try other setups....

I did try out the Fractint you posted ages ago that used flicker palettes, and it didn't flicker too badly. I bet some of the combinations you'll get with the two palettes you posted are pretty terrible though.

I've played with this technique several different times and have never really been satisfied with the results. I'll load up my animation editor and try out color combinations at 60Hz -- some combinations seem to "fuse," i.e,. blend perfectly. In these cases you simply cannot tell that it's swapping between two colors. In many other cases, however, the colors don't fuse at all, and you get horrible, headache-inducing flicker. Mixing 000 and 777, e.g., is totally unbearable, at least on my monitor. I made a little demo that just mixed all combinations of colors in the default NEOchome palette. I got 256 colors on the screen. Yup. But you had to look at it from across the room, with the contrast all the way down, and squinting, or your eyes would turn to jelly and ooze out your head. (Neither was a pretty sight.) :-)

I tried to come up with a formula or set of criteria that would predict which colors would fuse and which would flicker, but never could see a pattern. I did notice that some combinations look OK if the "blending area" is small, but not when you swap, e.g., two solid-color screens. In general, the larger the area, the more flicker. I also wonder if it's monitor-dependent.

Anybody know how to algorithmically pick colors that always blend? Given such an algorithm, one could write a program to find an "optimal flicker palette" -- one where the most combinations possible were rock-solid. This would yield more colors on the screen at once with little flicker and not much CPU overhead. As Howard pointed out, such a screen mode would be superior to Spectrum 512 because each of the N different colors could appear anywhere on the screen. You could probably even do interactive animation (read: GAMES) with this mode, although all your raster operations would be only half as fast.

Even if you couldn't find two palettes in which all combinations blended, finding enough to get 32 solid combinations would be better

than what we've got now: 16 colors, Spectrum 512, or brain-melting flicker.

Maybe if we assigned everyone reading this newsgroup a color combination to try and compiled the results... (Heck, there are only 262,144 different combinations. Aren't there supposed to be tens of thousands reading this group? Well then, that's only, what, 10-20 per person? I'll start the ball rolling with 000 and 001...)

>Spectrum 512, while allowing up to 512 colors on the screen,

The Spectrum 512 color claim is exceedingly misleading, by the way.
Each scan line is broken up into three parts, and each section can
use only 16 colors. Or 48 color changes across the screen. A true
random 256 color machine can have 256 different colors across one line.

A further problem is intensity quantumization. Suppose I have a color
with R=5, G=5 and B=1. If I take it down one level, I have R=4, G=4 and
B=0!!!! I can't get a lighter shade of the same color!!

unreasonable (like intel's).

>computer that could run 80x86/68000/6502 etc. binary code, by loading the
>proper microcode.

Promising 80 MIPS by Feb. 1992 for $40 in (large volumes, I assume)?
Sounds great, but it is just that -- a promise. Has intel ever made
good on the promise that its i860 would run at 50MHz so that the 150
max MIPS figure hyped by the press could come to light? How fast

does the chip run under normal conditions (i.e. with interrupt processing ON, using usual compiler output, using affordable (read slower) chips for memory)? Anyone want to take bets on whether intel's benchmarks had interrupts enabled, or ran the dhrystone benchmark from 80nsec memory?

At least with a 68040, with its familiar instruction set, we know what kind of performance to expect by simply looking at the average number of instructions per cycle and the capacity of the cache.

Other questions to be resolved: how efficiently would the processor emulate a 68000; is the microcode well geared to emulate its rich set of addressing modes and (small) irregularities? Would it have enough micromemory to do it? Can it address enough registers, or would it have to draft part of the cache for this role, inevitably slowing things down? How fast can it do a multiply or divide (it would have to do this very quickly in general purpose microcode to beat out an 040 with a built-in FPU with dedicated microcode)? We wouldn't know all of this until the machine and emulation software were implemented. That's a long way off.

Also, a lot of fast cpus will be introduced in this year of 1991, so that 80 MIPS (whatever that means in real terms of performance) may not seem as fast by comparison in one year. And 1993? Well, in computer years, that's ages hence. By then, the 68050 may be a more familiar sight. It is difficult to speculate on numbers relating its performance with the information we have now, but...there was a recent announcement that Moto just built the largest, most dense chip yet (for the US Navy, too advanced for mortals like us to buy, with a good amount of space devoted just to nuclear-proofing redundancy), and one must begin to wonder what they're going to be able to do with their commercial products (that don't need to waste any space for redundancy) by 1993.

>CISC emulation and multiprocessing capabilities. The pricing and performance
>seem to be exceptional to me and are some of the qualities associated with
>Clive Sinclair (and perhaps Atari), so that a Timex 200000K could soon be in
>our hands?

I'm all for power without price as much as the next guy, but my general feeling is that it's too soon to tell. As long as one can speculate all the way out to 1993, one can speculate about a lot of other things, many of them silly...like the Common Market banning American chips because the high frequencies might disrupt brain processes that control the ability of consumers to choose for themselves between labels stating "with hormones" or "without", or the Japanese opening their market to American rice due to a widespread boycott of Japanese submarine propellers :-P. When I see the TT040, or the PgC-ST at my dealer...or even at Toys-R-Us...I'll be convinced. Until then we can only make suggestions to Atari and hope that they'll listen. Right now we are having enough trouble getting them to put a 1.44 Meg drive into the TT...(by the way, TRH, your portable design is fine the way

it is, IMHO).

There is a good graphics card for 1040 from Matrix GmbH...
If I remember correctly 800x600 with 256 colors on a 14"/16" multisync.

I currently have one of these towers, and I am quite satisfied, altough
there is a Mega 4 inside, not a 520 or 1040. There is well enough
room for my two seagates, laser controller and two floppies with HD-interface.
And they are cooled down with 3 thermo-controlled fans.
I am just looking forward to fit a Delta Modul in...

Exchanger -> Apple File Exchanger, a program with you can move files from MS-DOS (and ST) floppies to Mac. Requires Mac with super drive or a Spectre GCR 3.0 with Atari ST.

I have a German HD-adapter on top of the WD-1772 02-02 floppy-controller chip. A small circuit board, that controls the clock-rate for the drive and some other things. Formatting and controlling software are included.

This HD-drive does odd things in Spectre. It is not very reliable to use. If a floppy is reported bad in HD-drive, it still works in DD. (luckily I have two drives...) But it works great with Apple File Exchanger. Even 1.44Mb MS-DOS floppies are usable. But you can not use 1.44Mb Mac-floppies with it (at least format, I haven't tried reading already formatted one). The problem is the step-rate of the drive. If I could find a program that could adjust steprate in Spectre, it would be very nice.

I have the HD-drive mainly for larger storage-capacity in ST-mode and for compatibility in AT-emulation.

I have a simple problem: I have a program that requires more than
the standard 200 lines in color. I know it is possible to use the
bottom border, but how?
If there is anybody out there that can explain me how to do it, please
let me know.

PRESS RELEASE

APRIL 2, 1991

On Saturday, April 27, 1991, Bob Brodie, Manager of User Group Services for ATARI will be visiting Southern California. Bob is a very dynamic speaker. Before Bob came to ATARI, he was a User Group President. He knows what it is like in the trenches.

This visit is being sponsored by the User Group, H.A.C.K.S., but attendance is open to all ATARI Clubs and ATARI owners. H.A.C.K.S. has rented a 325 seat theatre for the occasion. This meeting will be held at the Glendale Public Library's Main Branch Theatre, upstairs. The meeting will start promptly at 10:30 AM and is expected to last three hours. The Library's address is 222 East Harvard Street, Glendale, CA.

Take I-5 to the Colorado exit, go East a mile to Louise Street, turn North, go one block. An alternative route is to take the 134 FWY to the Central exit, go South a mile to Harvard street, turn East, go two blocks. For more specific directions refer to the L.A. County Thomas Bros. Guide, Page 25-E5.

Best of all, admission is FREE, but it is on a first come, first serve basis only.

As an added bonus The Computer Network, a local ATARI Computer Store, will be having an Open House in honor of Bob Brodie's visit. The store plans to have many developers, including, but not limited to, CodeHead Software, Gadget's by Small and WuzTEK, displaying their products. Store manager, Mark Krynsky, says to, "...expect special prices and deals galore."

The Computer Network is located at 1605 West Glenoaks Boulevard,

Glendale, CA. The Open House will be from 2:00 PM to 7:00 PM,

after Bob Brodie's lecture is over. If you have specific

questions about the Open House you may call Mark at 818-500-3900.

Remember, Bob Brodie's meeting will start promptly at 10:30 AM,

at the Library and the Open House will start at 2:00 PM, at the

computer store. Directions from the Library to the Store will be

available at the Library.

I thought this press release would be of interest to most Atari
users in California. Bye.....

Luis

> crap.

The SM124 is *true monochrome*, it supports no gray scaling whatsoever.
A pixel in a hi-res ST picture is either black or white there is no
in between. To some degree this is a feature. Combined with the 70Hz
refresh rate and 640x400 resolution the SM124 provides and incredibly
solid display for doing serious work.

It would be surprising if, say a 320x200 256 color GIF pic, was even
recognizable on it, though. There simply are not enough pixels there to
dither it properly.

I have seen mono GIF viewers that get around this by displaying in a
window which can be scrolled, thus allowing better dithering. You might
want to look around for such a viewer.

> Am I doing something wrong?

Not really... but a color display is much much better for viewing GIF pics,
even mono GIF pics (see below).

> 2) Does the STE have gray scales, you know, proper shades of gray, not
> just the nearness of black and white pixels?

Yes, 16 in 320x200 mode
4 in 640x200
1 in 640x400

> How can I use these scales?

View the picture on a color monitor.

> 4) Is it possible to get Gif images to look remotely nice on a STE?

Someone else answered your question 'no'. IMHO, this is complete BS.
Below is how I typically view GIF pics, usually 320x200 256color images.
Many times you can view these with no loss in resolution or clarity:

1. Get GIF pic.
2. Convert to Spectrum 512 format using GIFSPC (<-- available at an

archive near you)
3. View the Spectrum pic. (<-- viewers also available at archives)

Since you're new to the ST series, I'll tell you what Spectrum 512
format is in case you haven't heard of it:

Spectrum 512 picture format uses some software trickery to display more
than the maximum 16 colors in 320x200 color mode. It changes the color
palette on a per scan line basis with a maximum of three changes per
line thus, you can have up to 48 different colors per scan line.

This allows creation of pictures which display the entire 512 color
palette of the ST on screen simultaneously. I don't know if the extended
4096 colors of the STe are supported but you still shouldn't have any
problems using 512 colors.

If you try to to view incredibly hi-res pics (ie. 1024x1024 at 16Million
colors) they still won't look all that great. GIFSPC can scale the
resolution down, however... I have some 640x400 many color pics which
look very nice on my ST when converted to Spectrum.

>cleaning ball. Anyone have any neat ways of cleaning the rollers
>other than Q-tips and alcohol?
>Jonathan Whitcomb UUCP: <whitcomb%aurgate@mcnc.org>
>Alcatel Network Systems, Raleigh, NC Delphi: JBWHIT

Yes I know a way to keep the rollers clean. I still have my original 1986 Atari mouse. I think it was in 1987 I greased the ball with MS4 silicone grease from Dow-Corning. Since then, i have NEVER had to clean the rollers. However the ball is slightly more slippery, but I don't notice except when rubbing the ball over the table by hand.

I wouldn't recommend this trick with mice with very light balls, like Logitechs. This is just a trick I've tried and which a friend of me has tried; I do not guarantee it any further, but silicone grease seems quite inert to me.

Have fun and a clean mouse!

Thomas

2663. Bad news formatting from a Fidonet gateway

Newsgroup: comp.sys.atari.st
Date: 1991-04-04 12:17:36 UTC
From: steve@thelake.mn.org
Message-ID: <A842143364@thelake.mn.org>
Source record: 233479
Cross-posted to: news.admin,comp.sys.atari.st

I'm posting this message because mail to the offending site has gone unanswered, and because I'm getting repeats of this stuff.

A Fidonet gateway is not properly formatting messages for Usenet and possibly not properly counting bytes when batching news. The results are that messages are being transmitted with the text in a single line, and that subsequent messages are being lost because rnews gets out of synch with the batch. (This may be a matter of the long line overflowing an input buffer.)

Following is the bad news. I will fold the long lines; if they don't begin here with a > character they're a continuation. Note that the last line in each item is the #!rnews header of the following item.

Item one:

>From rnews Thu Apr 4 00:59:40 1991

2664. Cooling fan easy and it works!

Newsgroup: comp.sys.atari.st
Date: 1991-04-04 13:00:21 UTC
From: pbh@jake.cc.wayne.edu
Message-ID: <1991Apr4.130021.18125@cs.wayne.edu>
Source record: 233469
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I just installed a Radio Shack muffin fan (part # 273-243B) on my hot ST and I can report that it works like a charm. I left the machine on all night and it's still blowing cool air.

Installation was easy. I went for functional instead of pretty, so the fan is on top of the ST rather than inside. My ST would flake out after a couple of hours and the spot on top of the ST over the power supply would feel extremely hot. If I shut it down for 10 mins, it would work fine. I drilled two holes in the top of the ST over the power supply to screw the fan to the case. I drilled a third hole to run the wires through the top of the case. Then, I cut and soldered these wires:

```
-----red wire ------ / -------- red wire ---

---------black wire --- disk drive
fan power
connector
------ blue wire --- / -------- black wire ---

-------- black wire ---
```

The ST has stayed cool all night and I'll bet this even makes her last longer. Highly recommended for Z-ram owners. This cost me about $15; you can probably find a 3in 12V DC fan cheaper at a real electronics store, but they're hard to find around here so Radio Shack had to do.

Hi,
you can't use Rufus without GDOS. Just put GDOS in your auto-folder, create an appropiate ASSIGN.SYS-file and get the fonts. They should be found within the Rufus package.

2666. Aladin Mac emulator problems...

Newsgroup: comp.sys.atari.st
Date: 1991-04-04 15:12:48 UTC
From: ralph@lucifer.UUCP
Message-ID: <648@lucifer.UUCP>
Source record: 233470

Are there any Aladin users out there ??

I have just inherited an Aladin Mac emulator, complete with original disks and documentation. Unfortunately, several of the PD utility disks appear to be damaged in some way.

One of the disks has some games on, but when trying to mount it, Aladin claims that it is not an Aladin disk. I've looked through a Mac hints book which claims that this is can probably be fixed by holding down OPTION+'cloverleaf' keys during bootup. Does you happen to know if these keys are emulated, and if so, what they are mapped to ??

The other disk seems to start mounting properly, but it never finishes. I see the disk access light go on, the mouse pointer changes to wristwatch during several seconds of disk access. It then flips back to the pointer and back to the watch again and does a little more disk access. After some more seconds, the disk light goes out and nothing happens. I've tried leaving it for a long time to see if it's thinking about it, but nothing ever happens. The arrow pointer never comes back. The only way to get out of it seems to be a reboot...

What really bothers me is that these damaged disks appear to be the only ones that contain binhex and MacKermit, so I can't download any other PD stuff...

I have managed to get hold of a copy of binhex on a TOS disk, which I've copied over to Aladin using the Gem file import program, but it comes through in a non-executable form. Do you happen to know of a way to make it into an executable application ?? I am willing to start editing disks to get this to work....

Of course, an Aladin disk containing some kind of terminal emulator/download would be most welcome...

Thanks in Advance

I think you will be impressed. I've had SMPTE Track for a few years now and
it's a very powerful sequencer. You're right in that the only difference is
the SMPTE support. As for 'Gold' I paid for my update in November!!! I did
receive a beta version (or something) to keep me happy in the mean time but I'm
still waiting for the official 'Gold' hopefully with new docs as I found the
manual to be often confusing or incorrect.

The Union Demo uses a strange disk format that .MSA won't recognize or work
with. If it did work, the Union Demo would have been on atari.archive a long
time ago. :^) I haven't tried Ultra, but I could give it a try. Also,
Jampacker and Pompey Packer recently posted to a.a seem to have some disk
compression. I can probably play with those a little and see what happens;
too bad they don't have docs. :^(

Someone on Fidonet was supposed to send me the Mindbomb demo and a couple of other new ones; I should have gotten them a week or so ago. When or if I do, I'll try to get them to a.a in some form.

>
> Jartsu
>

Actually, there are a number of manufacturers of removable mechanisms
(Bernoulli, Syquest, and Ricoh are most popular). Each of these mechanisms
have their own advantages and disadvantages. Syquests are cheapest and
most common, but are relatively unreliable, causing a number of companies
in the Mac market to avoid or drop them. Ricohs are a new technology
which promises to be quite reliable, but are also more expensive.
Bernoullis are the most expensive, but are an established, reliable
technology. There are also more "exotic" technologies such as
megneto-optical drives, flopticals, and so on.

> ... the maker of the housing ...

Those mechanisms are used by a large number of companies, who add a case,
power supply, cables, driver software, documentation, and perhaps other
bundled software. The other factors are how much testing the company does
on the mechanisms it ships (to weed out failures), the quality of their
engineering, and the warranty and service that they provide. While some
companies may just be "the maker of the housing" there is a lot more than
that going on at any quality drive vendor.

The Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST) Atari user group,
will have its 16-bit (ST) meeting
at 7:00pm on Wednesday, Apr 10, 1991
in MC2009, the DCS Course Room,
on the 2nd floor of the Math & Computer Building
at the University of Waterloo.
The meeting starts at 7:30 pm.

This month, Allen P. Bargen, Sysop of EX-10, will discuss
Bulletin Board Systems.

Also available will be the English translation of the Midi Maze II
docs provided by our own Pat FitzGerald.

In addition to our disk-of-the-month, over 170 disks
are available from our library.

This month's "The Hard Copy", the KWEST newsletter,
will include info about BBS's, various software reviews,
info on the upcoming Windsor/Detroit International Atarifest,
plus pictures of the ST Notebook and Pad prototypes.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Call 579-3695 for further details or send email.

Hope to see you there,
Dani Roloson

> - no matter how you try to hide it...

That's not true. Semantically, "i += 2;" is equivalent to "i = i + 2;" but "++i += 2;" is not equivalent to "++i = ++i + 2;" because the people who designed C are smarter than that. The side-effect is performed only once.

But regardless of that, you are suggesting that what happens in a C statement is uninterruptable, so doing something in a single statement makes it safe when it might be unsafe in multiple statements. This is not true. On the 68000 family, an interrupt can come between any two instructions. Individual instructions can't be interrupted, but the bus can be arbitrated away (for DMA, for example) between the read and the write of a read-modify-write instruction, except for the TAS instruction which is explicitly atomic.

Dunno, maybe this can help though:

>Is there any software pacakge/integration of packages,
>that can do this for me using Spectrum? I do want the
>advantage of all those colors on the screen at once...
>

There is a program called Unispec, which supposedly lets you create Spectrum 512 animations. It's a commercial program. There's a player on atari.archive called ANISPEC and a couple of animations: WALL, 3D-512 I think, and another one. Unispec can be bought for under $30 mail order I think.

There's also a program, shareware or commercial, not PD, that lets you do 3D modeling in 512 colors, but I don't remember its name. I have a sample output pic. Leave me some e-mail if you're interested and I'll post it on atari.archive.

dmb@wam.umd.edu (David M. Baggett) writes:

>Anybody know how to algorithmically pick colors that always blend?
>Given such an algorithm, one could write a program to find an "optimal
>flicker palette" -- one where the most combinations possible were
>rock-solid.

You can try to pick colors that have aprox. the same intensity. To this
you can use the NTSC formular :

Luminosity = 0.299*Red + 0.587*Green + 0.114*Blue

I have some code at here that can display 256 graylevels on the mono screen.
(written in C). The program is less than 50 lines long, and features
an advanced errordiffusion ditering algoritm, with a small edge sharping
filter (simple laplace). This have been coupled with a 3 screen 'flicker'
mode. The result is approx. the same as 256 grayscale VGA LCD screens (I
think mine is better, because there is no shadows running around the screen,
but...)
The 3 screens is build to that the 'on' pixels is equally distributed on the
3 'planes' - this avoids flicker.
All this could used with color too, and I think the result would be even
better because you can pick colors which is closer to each other (than on and
off)...
In color mode you can probaly show true-color, but you will need to make some
additional code, to handle interesting subjets - such as picking reprensative
colors from the picture file...

The program IS quick hack, and therefor it only runs on mono in 640x400.
I will send the source to who-ever that is interested...

Klaus (micro@imada.dk)

2684. Flicker Palettes (with minimum flicker)

Newsgroup: comp.sys.atari.st
Date: 1991-04-04 23:13:41 UTC
From: logajan@ns.network.com
Message-ID: <1991Apr4.231341.16386@ns.network.com>
Source record: 233482

Howard Chu suggests alternating frames (flicker palettes) to increase
the apparent number of available intensities per pixel R G or B.

He also (cleverly) suggests an unbalanced duty cycle -- two frames
of palette X and one frame of palette Y.

Dave Baggett mentions that some combinations of flicker intensities
are unsatisfactory, especially flickering between two extremes.

So I have made some tables of the possibilites of such an unbalanced
duty cycle flicker method. In the first table you can see the
redundancy of many of the intensity values. For instance many of
the intensities can be derived four different ways.

```
Y Palette value (1/3 duty cycle)
7 6 5 4 3 2 1 0
| | | | | | | |
7 - 21 20 19 18 17 16 15 14 . . . . . .
6 - . . 19 18 17 16 15 14 13 12 . . . . . .
5 - . . . . 17 16 15 14 13 12 11 10 . . . . . .
4 - . . . . . 15 14 13 12 11 10 9 8 . . . . . .
3 - . . . . . 13 12 11 10 9 8 7 6 . . . . . .
2 - . . . . . 11 10 9 8 7 6 5 4 . . . .
1 - . . . . . 9 8 7 6 5 4 3 2 . .
0 - . . . . . 7 6 5 4 3 2 1 0
| | | | | | | |
^ 7 6 5 4 3 2 1 0
|
|----- X Palette value (2/3 duty cycle)
```

In case you can't understand the above table, the one below puts the
Y palette value in better alignment and throws out selected redundancies.

```
Y Palette value (1/3 duty cycle)
7 6 5 4 3 2 1 0
| | | | | | | |
7 - 21 20 . . . . . .
6 - 19 18 17 . . . . .
5 - . 16 15 14 . . . .
4 - . . 13 12 11 . . .
3 - . . . 10 9 8 . .
2 - . . . . 7 6 5 .
1 - . . . . . 4 3 2
0 - . . . . . 1 0
```

```
^
|
|----- X Palette value (2/3 duty cycle)
```

Finally, I have a table of average values of intensity.
Note that the difference between X and Y values is never
greater that +or- 1. This should minimize the AC ability
of the eye to detect flicker. If our eyes were DC only,
then any of the other redundant combinations would have
worked as well. :-)

```
X X Y # Intensity (average)
----- -- ---------
7+7+7 = 21 = 7
7+7+6 = 20 = 6.666
6+6+7 = 19 = 6.333
6+6+6 = 18 = 6
6+6+5 = 17 = 5.666
5+5+6 = 16 = 5.333
5+5+5 = 15 = 5
5+5+4 = 14 = 4.666
4+4+5 = 13 = 4.333
4+4+4 = 12 = 4
4+4+3 = 11 = 3.666
3+3+4 = 10 = 3.333
3+3+3 = 9 = 3
3+3+2 = 8 = 2.666
2+2+3 = 7 = 2.333
2+2+2 = 6 = 2
2+2+1 = 5 = 1.666
1+1+2 = 4 = 1.333
1+1+1 = 3 = 1
1+1+0 = 2 = 0.666
0+0+1 = 1 = 0.333
0+0+0 = 0 = 0
```

2686. MEGA STE trouble

Newsgroup: comp.sys.atari.st
Date: 1991-04-04 23:24:28 UTC
From: larserio@IFI.UIO.NO
Message-ID: <CMM.0.88.670807428.larserio@kvart.ifi.uio.no>
Source record: 233485

I have two problems with my new MEGA STE, and wondered if anyone out there
hadany good ideas for fixing them:

1) When using STEREO DMA sound (not normal ST sound) I get "static" (small
clicks kind of) in the sound. Sounds almost like a spark. Occurs even
when there is no sound (as long as the voulume is on). It has has no
strict pattern and occurs every now and then. Anyone have an idea ??

2) When the HDis active I get vertical flickering bars on my monochrome
monitor. The picture is flickering always, but it's really annoying
when the harddisk is working..... Is this interferencefrom the HD on
the RAM-chips (or somthing like that). Anything I can do about it ?

3) Ohhh, yes - One more thing - SYSMON doesn't work on the MEGA STE :-)
I really miss it :-(

From: geoffc.zebedee@tharr.uucp
Message-ID: <7240412@zebedee>
Source record: 233447

I've just installed formdoit 1.1 on my ST and I love it ! Very nice little program which makes using GEM much quicker. Now for a couple of queries ..

1. Why do most dialogues come up with the button letters underlined and some don't ? eg: Show info on a disk drive within Neodesk 3.0 doesn't give any ALT-key combinations.

2. I have a dialogue box within a program that I have written which I want to have an '!' icon on. I don't really want to have to draw one by hand so does anyone know how I can import the icons supplied with formdoit 1.1 into my RSC file ? I use the laser C RSC editor but also have nrsc/k-resource if necessary. I could'nt find any way of converting the degas .bl3 files into the required format.

Advthanks,

Geoffrey

>the answer is no are there any similar type games that you can recommend?

There is a good mono-only Lode Runner clone at atari.archive. It's
from Germany and I think it's name is GO_UP.

I get this on my STe as well. Not as often as it seems you do, however. Mine
occurs usually about once every two weeks or so. Could it be non-computer
related, such as your amp or speakers?

I don't have an STE so I am assuming that you are playing samples.
If the sample is recorded so that when you look at it on a sample
editing program, the sample is not vertically centered over the "zero"
output line, you will almost invariably hear a "pop" at the beginning
and end of the sample. This is because the player is trying to jump
from zero output to a higher output. In which case, any computer
will pop while trying to make the sound.
Of course, this is all assuming that you in fact _are_ playing samples.

If any of this makes any sense to you, then good for you! :-)

2697. (INQUIRY) ST players for Amiga animation and *.SPS files

Newsgroup: comp.sys.atari.st
Date: 1991-04-05 02:03:51 UTC
From: bgodot@wixer.UUCP
Message-ID: <9104050203.AA02014@wixer>
Source record: 233491

Is there an ST player for the Amiga animations that are played with
the Amiga program 'flick'?

Also, what kind of ST graphics files are those with the .SPS
extender? I downloaded a number of them (NAGEL**.SPS) , but can't view
them. What do I need to view those?

2698. Problems with ST Writer (3.8) double column format.

Newsgroup: comp.sys.atari.st
Date: 1991-04-05 02:05:17 UTC
From: bgodot@wixer.UUCP
Message-ID: <9104050205.AA02028@wixer>
Source record: 233492

I've been having problems with the double-column formatting with version 3.8 of ST Writer.

It truncates the line at column 105, no matter what I set the second right margin to.

I'm using a Star NX-1000 and the EPSON MX-80 printer driver (EPSMX80.DAT). It could be the printer driver messing it up, but seems the closest printer driver to the Star.

Is there a printer driver specificly for the Star NX-1000?

2699. Analyze! Metafiles (HELP!)

Newsgroup: comp.sys.atari.st
Date: 1991-04-05 03:26:14 UTC
From: eahsnsr@nmt.edu
Message-ID: <1991Apr5.032614.17167@nmt.edu>
Source record: 233487

Has anyone used the make Metafile option of the _Analyze!_ spreadsheet?
It doesn't seem to work right. The files it creates don't correctly load
into DP programs. Also, when I use GEM2PS, the program creates a series
of definitions and the like, but never makes any print information.

Could it be that it is creating IBM Metafiles? Or does the fact that it
must use GDOS automatically mean that it is trying to create GEM Metafiles?

Message-ID: <670918973.4@egsgate.FidoNet.Org>
Source record: 233342

I just bought the March/April issue of Atari Explorer and it is great. Some refreshing news! I would highly recommend this issue. There is a review of the newest Quartet sampler/sequencer program, Portfolio Management, Lynx Games, DTP using Pagestream, A guide to fonts, review of FSM/GDOS (new GDOS from Atari!), Font Designer, coverage of Atari at Comdex and CES shows, a hands on review of the Mega STE and a great interview with Greg Pratt, Atari U.S.'s General Manager!

In the interview, he mentions that "one third-party developer is expected to announce an Ethernet card that will fit in the VME slot on the machines". He also said: "Besides Unix, we're also developing significant enhancements of our existing technologies to keep abreast of current developments in competing markets. For example, we've received good reports on the design chips that will control our new high-density 1.44 MB floppy drives, and expect shortly to announce a range of upgrade products and optio

ns based on this technology. We're also moving swiftly towards being able to supply state-of-the-art 14" and 19" monitors for use with DTP, CAD, and other graphics-based applications."

I just thought this was an interesting bit of info I would pass along.

From: dddean@bluemoon.uucp
Message-ID: <JFXwZ1w164w@bluemoon.uucp>
Source record: 233266

Hello:

I have heard that you could connect the Atari ST to the Atari 8-bits, and then store the 8-bit software on the 3.5'' disks that the ST uses.

I was wondering what all was involved in this process. I know that you need the "Null Modem" cable, and that the 8-bit will need some sort of interface, probably the 850... after that, could you just use terminal software for each computer, and then "download" from the 8-bit to the ST??

Now... I have an Atari SX212 that has both the RS232 port for the ST and the port that the 8-bit uses. Would it be possible to just use the modem as a link between the two?? Could I do so without the Null Modem, and just use my RS232???

ALSO: I have heard that the ST can RUN about 90% of the 8-bit software if you have another hardware module... anyone else heard this??

Thanks for any replies!!

>considered reasonable when the ST was designed.

That's very true..!

Of course, the ST was designed over *FIVE YEARS* ago, and has never really
changed since then..

(WHY???)

An Atari 8-bit screen only took up 8k of RAM... if you want to take it to
extremes, an AstroCade only needed 2K to display a full screen..

Why not change with the times..? Why not provide competitive graphics
modes..?

Why...?

Sort of, they contain the 'Toolkit' which make the Mac tick..

>-what are they exactly (numbers etc...) so. what would I ask when going shopping ?
>-are there differend versions, if so what's the newest / one for GCR 3.0 ???
I haven't got the numbers handy, but note: there are 64Kbyte and 128kbyte
versions. You need the 128K versions for Spectre 3.0. The Spectre manual states
the Apple part numbers.

>-anythin else I should know ???
If all else fails: I have seen Spectre's using EPROM copies. This is illegal
of course!!! But I guess we haven't seen the end of this piracy, because Apple
is becoming more and more fussy on their ROM sets.

Hope this helps.

- they all seem to be self-congratulatory messages between various
- software pirating groups...

And there's something wrong with that? Maybe they should congratulate one person. Maybe they should congratulate, maybe -- just maybe, Bob Retelle? Nah. It would read, "Greetings to Bob Retelle. Scr*w everyone else," or something like that, as they do.

- We've got a wonderful body of "demos" to run on our computers, but
- do they equate into anything "real"..?

I don't know about you, but I bought my STe just to see the CoolSTe demo by An Cool. When I'm not reading Usenet, CoolSTe is always playing. I can't get enough of Janet Jackson's 'Rhythm Nation,' nor of Mickey Mouse bouncing around among 4096 colors.

Okay, sarcasm mode off. Actually, some of the groups create games for the ST. Is that useful enough? :^D They also make file packers. Then there's TCB (The Carebears) Tracker, Soundtracker module creator. I'm sure there's other stuff that we don't see here in the States.

But I agree with you, too bad we don't see more productivity products from them. I think they could write some very nice stuff.

>advantage of all those colors on the screen at once...
>
>Thanks
>
>gunnar
>alexd@milton.u.washington.edu

There are several ways to do this. First of all, to get animation using Spectrum 512, there is a program called Unispec, which is actually an upgrade module to Spectrum, which turns it into a desk accessory and adds many new features (including animation.) The new additions alone merit recommendation for anyone who uses Spectrum, such as better anti-alised(sp) functions, and an improved dithered blur, just to name a scad few.

As for rendering it in spectrum, there is a painful way, and some other not so painful ways...

First of all, you could always just use Cad 3-D (I believe you are referring to CyberSculpt, if not, then the rest of these techniques do not apply...) and do a straight degas import into Spectrum, frame by frame (also, Cyber Control, an animation scripting language, is recommended for this) and tweak the colors using spectrums global color commands.

There is also a program from the magazine STart, called RezRender. This program can use Cad 3-D objects, and raytrace them using various styles (flat polygons, gourad shading, off the top of my head), BUT can only render in 16 shades (yes you can make 16 psuedo-shades, on most colors except some such as grey). It does, however have many excellent features like shadowing, chekerboard plane backgrounds, gradient backgrounds, and limited animation. I believe this can be founds in the February 1989 or 1990 issue of STart.

Another program, called GFA Raytrace (which is VERY hard to find, but one source would be on the British-mag ST Format, not sure which issue) which will raytrace objects in full, glorious 512 colors, BUT it is not compatible with Spectrum 512, and the tools are quite limited.

Also, there is news of a new program from a company called Lexicorp,
which is creating a 3-D rendering system far superior to the Cyber series.

In summary, it is a bit of a pain to do 3-D animation in Spectrum.
Like any system, you need gobs of memory (even at 8 Megs you run out of room!),
and things like an accelerator are VERY handy to have (it took me at least
12 hours to render 16 frames of a rotating object on a stock 1040 using
RezRender).

>Sundog runs on any color ST. It is one of the true lost classics.
>A really great game!

Apropos the original question, I run it on one of the earliest 520 STs, no expansions. So should run on anything with a color screen.

Apropos Robert's comment, I personally found it tediously slow, after a while. Was cute at first, but after a while the realism-effects begin to feel like annoying time-wasters. Like, I want to buy a new X-coil, so I go to the parts shop, and then have to sit around twiddling my thumbs while the salesman waits on everyone else in the shop first. If I want to wait in lines, I don't need a computer game to help me out.

From article <UbyaIxC00UhBE0ynEu@andrew.cmu.edu>, by mc4c+@andrew.cmu.edu (Mark Choi):
> You want constructive, TRH? Here it is.
>
It's nice to see what started as a bit of a slanging match ending (I hope) in a constructive dialogue. I'm not competent to evaluate them, but there were certainly some interesting suggestions in Mark's article.

> We need to get the jump on the market, or else you
> may find that the market has gotten away.

It may interest/sadden people to know that Atari UK's marketing manager (Peter Stadden, if I've remembered his name correctly), in an interview published in the UK weekly 'New Computer Express' dated April 6th, was hoping that the machines shown at CeBIT would be with UK dealers in 18 months. I don't know what the market for handwriting recognition will be in October 1992, but I'd expect the notebook market to have moved on a bit from the current ST_Book spec by then. Perhaps Peter Stadden is just being conservative (or perhaps Atari UK has slipped down the pecking order for new product releases).

Most of the rest of the interview was about how Atari UK are trying to move from a games image to that of a company supporting serious applications on its 680x0 range. I hope the company succeeds, but I can't help feeling that the move is at least three years too late. I should stop at this point, as I started out by praising Mark for being constructive, and I can feel myself sliding into doom 'n gloom mode...

2717. STe SIMM Pin Layout

Newsgroup: comp.sys.atari.st
Date: 1991-04-05 13:36:16 UTC
From: camm@els.ee.man.ac.uk
Message-ID: <2371@m1.cs.man.ac.uk>
Source record: 233422

Hi All,

I have just upgraded my 520STe to 2 Megs so I now have 2 1/4M SIMM's rattling about in a draw. A colleague of mine is working on a project at home and could use this RAM. So what I want to know is, what is the pin layout for these SIMM's.

If you have the information or can point me in the right direction I would be most grateful.

Thanks in advance,

Ian

If you have a copy of VKILLER, version 3.0 or later, just do a KILL on the disk. The resulting bootsector, with all non-critical data zeroed, will also have the necessary values to be readable on any MS-DOS system.

Diamond Back II V2.20 should be in the distribution channels by the middle of next week. I had a number of startup problems after regaining control of Diamond Back II from Data Innovations. Primarily, the printer was 4 weeks late in delivering the disk labels(and since I prepaid for speed I had no choice but to wait). It seems a run of 2000 labels is very low priority to a label printer whose normal runs are in the hundreds of thousends. Anyway, I shipped V2.20 to all the major distributors on Tuesday and they should reach the mail order outlets next week.

Put the GDOS file in the autofolder. Put everything else in the root.
Then reboot. It worked when I did that. I used a new disk, copied the
stuff over from my ramdisk, rebooted and then clicked on rufus. Nice
program. I wonder how it would act at 9600 bd. Text routines don't
seem to be the most efficient....

The Milwaukee Area ST User Group (M.A.S.T.) will be sponsoring an Atari Swapfest on June 2nd, 1991 in Milwaukee, WI.
We wish to thank the following developers and vendors for committing to attend the show:
Apple Annie
Branch Always Software
Compu-Seller West
Dennis Palumbo Fonts
H&H Enterprises
Kolputer Systems
Micro Magic
M-S Designs
SKware One
Timeworks
Toad Computers
We also will have the new Atari Coupon Books And Catalogs from E. Arthur Brown Available to the attendees.
We hope that you will be able to join us in Milwaukee for this show.
We will be updating this notice as we have more information.
Ticket cost is two dollars in advance, three dollars at the door.
If you are a developer or a vendor and would like to display, please leave E-mail to Bob Carpenter, or David Mumper on Genie or to Rlaudenbach on Delphi or to Jim Hand on Compuserve or to Teri Krofta on the Net at baaa02@mixcon.com. for more information.
If you need advance tickets please send two dollars (check or money order please) and a self-addressed envelope to
M.A.S.T.
P.O. Box 25679
Milwaukee, WI 53225
For more information please leave e-mail to one of the people listed above.

Boy, it feels funny replying to one of my own postings. I found the reference I wrote about before. It is:

_Visual_Interface_Guidelines_ by Frank Cohen (of Regent Soft fame - alas Regent is no more 8-()
ST Log, #28, February 1989 pp. 20 - 32

If your local users group doesn't have a packrat like myself, you could try to get the article in 1 of 2 ways.

1) Contact L.F.P. Inc in N. Hollywood, CA 91615 (yes, that's Larry Flynt Publications - check out a Hustler for a more complete address)

2) Get in touch with Clayton Walnum - former editor of ST Log at:
Taylor Ridge Books
P.O. Box 48,
Manchester, Ct. 06040

He published a compilation of his ST Log C-manship articles, and might be persuaded to publish other things. I'd like to see some of the out of print ST books revived, and Claus Brod's book in English.

bye,
Bob Pegram

> I call up B&C and San Jose Computer, and sure they have it but at $25 (!!)

If it's pins you want, stock up on 6800's and 8080's. The 1772 is more
"sophisticated" than a lot of the 40-pin FDC's you'll find. I don't know if
$25 is the best price, but don't let the smaller pincount fool you.

>>jcksnst@nmt.edu (Admiral JC) had some questions about
Sideline Software of Ft Lauderdale FL and there great prices.
Others contributed there experiences with the company.
Here are mine:
Im at Florida Atlantic in Boca Raton. On my way home I went
looking for Sideline. I was a bit suspesious as they were
listed in the white pages but not the yellow pages. After
about a half-hour I found them. They told me they did no
sales there (only mail-order), but were part of a computer
store nearby called Computer Room. I did see that they had
a good stock of software, but was not allowed in. I figured
if they were part of a store, I could get the same prices
at the store. I was wrong. At Computer Room the prices
offered where the same at any store. Even the stuff with
the great prices at Sideline where $20-30 more at the
Room.
Sideline does exist. How they can offer such good prices
I do not know.

>
>No.

Now Ed, let's not bash these demo writers too much. :-) While in general it seems that many of these demo authors are egomaniacs who don't follow guidelines, there are some of them that write "useful" stuff. (That is, if you consider games useful.) At least, I know the game Enchanted Lands was written by some former demo hackers. This shows in the game itself -- the scrolling is smooth and full-screen, and the music is good. Not my favorite game, but techincally quite impressive.

I'm sure demo authors write other things too. (I realize you were being a bit sarcastic.)

>- If you bother to wait through all the text on most of these demos,
>- they all seem to be self-congratulatory messages between various
>- software pirating groups...
>
>And there's something wrong with that? Maybe they should
>congratulate one person. Maybe they should congratulate, maybe --
>just maybe, Bob Retelle? Nah. It would read, "Greetings to Bob
>Retelle. Scr*w everyone else," or something like that, as they do.

I agree with Bob. I think it's pretty tasteless to put cheesey messages to one's friends in demos, and besides that, it limits the usefulness of the demo. One purpose of demos is to show off the computer. I remember the "walking robot" demo from Atari 8-bit days -- I bet that sold a few machines. But no store owner is going to put a demo up that says, "Howdee to all crackurs out there" or some similar garbage. Correctly spelled messages might be nice occasionally, too. :-)

>- We've got a wonderful body of "demos" to run on our computers, but
>- do they equate into anything "real"..?
>
>I don't know about you, but I bought my STe just to see the CoolSTe
>demo by An Cool. When I'm not reading Usenet, CoolSTe is always
>playing. I can't get enough of Janet Jackson's 'Rhythm Nation,' nor

>of Mickey Mouse bouncing around among 4096 colors.

I know I've already bantered about this before, but I think demos often miselad non-programmers as to what the capabilities of their machine actually are. You can do a heck of a lot more in a demo than you can in general-purpose code.

The recent thread on flicker palettes provides an example: Suppose I come up with two palettes in which 32 combinations blend with no flicker at all. Then I can write a demo that puts 32 colors on the screen at once with no flicker (of course, putting a note at the bottom of the screen saying, "By the way all u crakers and hakkurs, count the colurs on the screen HA HA wunder how i did that?")

That doesn't mean that anyone could use my 32-color "screen mode" for _anything useful_. You couldn't write a paint program to take advantage of it. (Well, maybe.) In any case techniques like these often break down when you try to make them general-purpose.

>But I agree with you, too bad we don't see more productivity products
>from them. I think they could write some very nice stuff.

To be honest, I'm not so sure that's true. I don't mean to be critical here, but many of the demos I've seen

1) simply crash when run from a hard drive
2) take over the entire system
3) provide no way to exit the program, probably because they trash the OS in horrible ways
4) are usually weird and unpolished in their operation
5) rely on all sorts of undocumented and unsupported hardware "features", e.g., shifter bugs, instruction timings, etc.

It's as though the authors only spend much time on the "nifty hack" parts of the demos -- the routine that puts 522 colors on the screen or whatever, and then just do a half-baked job on the rest. It doesn't take much work to make a well-behaved program, but it requires a kind of discipline I guess.

You can't release a productivity program with any of the above 5 problems unless you want bad sales. Games, on the other hand, are pretty much like demos in that you don't have to follow as many rules.

It may not be a problem at all. Some samples aren't sampled at the max rate, and therefore will seem a bit staticky. The higher the sample rate per second, the better the sound quality.

If you want to get rid of the popping and static, get better samples at higher rates like 47KHz for example. Careful though, this requires MEGA 4 amounts of memory to do this, and it doesn't last long.

>modes..?

I think that's a good question... Lessee... Lots of systems out there
have 1280x1024 monochrome displays now. There have been 2048x2048 and
larger for the military and other applications for a while too. I just
wonder - if you can draw 1280x1024 = 1.25Mpixels/frame, 60+ times a
second, why can't you do it in color? Doesn't increase the speed requirements,
just the width of the bus...

I would like to build a true-color board that uses, say, 16 bits per pixel
and 8-bit style display lists. Then hardware scrolling in either direction
only becomes a matter of updating display list pointers, instead of copying
huge amounts of pixel memory. I guess there's not much point to having
multiple graphics modes though. (is there?) Lessee, 1.25Mpixels @ 16bits
gives 2.5MBytes/screen. Big deal, memory is cheap. We'll say the board has
16MBytes of memory, enough space for 6 screens plus 1MB for display lists
and palettes/CLUTs. (Ok, 16MBytes *minimum*.)

The display list entries will have to include the address to begin drawing
a scanline from. Let's have an optional flag to include palette and address
changes at arbitrary pixel counts into the scanline - that gives us the
ability to move windows around the screen very rapidly, and allow windows to
have their own independent palettes. All of this can be achieved with a
simple state-machine, so it should be simple to do quickly in hardware.

I was also considering one or two separate bitplanes for text-only, which
would be overlayed simultaneously. (Who needs multicolor text anyway, eh?)

Haven't given much thought to the text-management though, maybe a separate buffer would be harder to manage than it'd be worth. (But geeze, who wants to waste cycles scrolling 24-bitplanes worth of *text*??)

Hm... Is there a practical use for 64K colors out of a larger palette? Mebbe 8 bits per pixel is sufficient, especially given that palettes can be switched on the fly. Mebbe there *is* a reason for multiple modes... Oh well.

It seems to me that most of today's workstation vendors spend so much time on how to draw things into their frame buffers, (Oooo, we can do 6 trillion shaded polygons per second!) but no time at all thinking about what they can do with the frame after it's been drawn - no thought spent on panning, zooming, rotation, what-have-you... The display-list idea is incredibly powerful. Have another option for memory-increment to next pixel - this gives you the ability to do instantaneous reductions (zoom-out), as well as 90-degree rotations (corner-turns) just by choosing the appropriate increment. Use another option for pixel-replication, with a count, and you get instant expansion (zoom-in). All of this can be implemented with just an adder/counter circuit and maybe a couple more address registers.

Oops. Keyboard run-on again... Well anyway, if I ever get this thing built, I'm sure y'all will find out about it. }-)

Source record: 233435

Greetings all,

I am currently using rufus on my st, and I have a few questions. I would like to change fonts, but I only get a choice of system 6x6 or TMAIL ANSI. When I use TMAIL ANSI, I can't seem to change the font to fit on my screen? The Documentation is all in german, so that is little help to me. Any info would be usefull....

Source record: 233440

Well, I finally got around to moving all of the new uploads out
of new. There are no more, with the exception of the gcc upgrades, soon to be
released. Roy, if you're out there, please mail me. I missed one
part somewhere, and lost your address.

Also, the index reflects all of the ??? upgrades I've recieved to date.
There's still two more directories to go, I'm beginning them now.

If you sent something (upload or index upgrade) and it's not thee,
please let me know. That's all I have laying around here.

I just posted this file to atari.archive. It's a SPectrum Uncompressed Ray Tracer. I briefly referred to this program a couple of days ago; this is the one I was thinking about when I mentioned solid modeling in a Spectrum 512 format. Actually, this is not the program, but a text file introducing the program, and a demo pic.

Also, the file ATARIPIC.LZH in /newitems is an archive containing pictures from ZNET of the new Atari CDAR505 CD-ROM, the TT running Unix, and the Notebook and Pad. To whoever uploaded it, THANKS!!

From: saj@chinet.chi.il.us
Message-ID: <1991Apr06.072022.29674@chinet.chi.il.us>
Source record: 233274

I recently got a BMS tape backup system. As is usual for BMS products, its good points are superb compatibility with multi-vendor setups and incredible support. As is also usual with BMS products, the bad point is incomplete software support. Has anyone written any utilities that work with the BMS tape backup? Care to let them out?

You may see the ever-popular Uniterm mentioned as a possible program. You
would not have to sell your color monitor. Uniterm supports med and hi rez.
It's also very fast, full-featured for main-frame and *nix systems, runs
external programs (I run XYZ.TTP) with a mouse click for Zmodem), very
powerfull script language and ability to use GDOS fonts. Full GEM,
and reliable code (not one crash in three years of use). Lastly, it's
in english, comes with extensive documentation, and is free. Current
version is 2.0e. I love to use it with vi (if I have to) where I can click
on the screen and the cursor goes there for editing.

Really ?? (I JUST got it and can't read German(?!)) Does anybody
have an English version of the .RSC ?? I can guess a lot but not all
of the meanings of the menu entries.

Hmmm..... Rufus (I'm using it now) seems to NOT update the screen (I
keep having to do Control-L's in Emacs), I assume this is a setup
problem..

Also, it doesn't let me mark text in GNU-Emacs (Control-Space) Is
there a solution for this (NOT vi , I use Gnus, and VM for news and
email almost exclusively)

2756. .IMG/Pagestream/Postscript

Newsgroup: comp.sys.atari.st
Date: 1991-04-06 20:10:33 UTC
From: alexd@milton.u.washington.edu
Message-ID: <1991Apr6.201033.3056@milton.u.washington.edu>
Source record: 233252

Hi.

I have yet to purchase the software, but I know I am going
to be using .IMG files (of which I know little or nothing about),
AND am going to NEED to print these .IMG in a Postscript DTP
environment...hence Pagestream comes to mind. I have been holding
off buying 1.82 due to the purported soon release of 2.x.
I will have a TRUE PS printer shortly- the NEC Silent Writer 90.

My question: Am I in for trouble in placing .IMG files into
a Postscript format? Should I expect loss or degradation in the
conversion? is there a conversion? and, what .IMG editing tools
are out there? TOUCH_UP ? others? Are .IMG typically large?
And if converted to PS.. can I assume that were I to go to a
printhouse for greater than 300dpi, i will be able to get the
higher resolution for the graphics images?

your help is very much appreciated.
thanks

gunnar

I do .img imports into Pagestream all the time.

> Should I expect loss or degradation in the conversion?

.img files are simply compressed bit images. So, to whatever degree
PageStream distorts bitimages upon resizing is your only true worry.
Bit for bit reproductions should be error free.

>Are .IMG typically large?

Depends. Some of my clip-art type scans with the geniscanner produce
.img files that are 1/6th the storage of a raw bitmap.

>And if converted to PS.. can I assume that were I to go to a
>printhouse for greater than 300dpi, i will be able to get the
>higher resolution for the graphics images?

I don't know.

Sorry, i should have included this question in my first posting.

Question: will Pagestream allow me to place text on a .IMG
raster without obscurring elements of the raster definded by
the "box" that it creates to house the text? In other words,
can one place individual characters of text on top of a .IMG
file without the "text in-a-box" approach?

Sorry for the bad wording of the question.

Thanks
gunnar

2760. Noisetraker for 512K???

Newsgroup: comp.sys.atari.st
Date: 1991-04-07 02:57:10 UTC
From: eahsnsr@nmt.edu
Message-ID: <1991Apr7.025710.4059@nmt.edu>
Source record: 233264

Is there a PD program in existence that will allow me to make
my own .MOD files on a standard 512K TOS 1.0 system?

The programs on atari.archive: sync.lzh (demo), TCB Tracker (demo)
and Noisetracker 1.5 all don't run or bomb most heinously. They all
run fine on my friend's 1Meg TOS 1.4 system.

I really want to be able to make these these files without having
to upgrade, yet.

I would appreciate any help!

Eric A. HOBBS!
eahsnsr@JUPITER.nmt.edu

2761. Re: lynx

Newsgroup: comp.sys.atari.st
Date: 1991-04-07 03:10:16 UTC
From: Shervin.Shahrebani.Of.250/744@f744.n250.z1.FidoNet.Org
Message-ID: <671019520.0@egsgate.FidoNet.Org>
Source record: 233343

You are wrong. Atari has been continuously advertising the LYNX. They have about 18 games now with 16 more to come by summer and another batch by the end of the year. I think that Atari will do really well with its LYNX. Also, the Portfolio is selling really well, and now that it sells for $299 U.S. instead of $399...

From: scott@cmb00.larc.nasa.gov
Message-ID: <SCOTT.91Apr7002531@cmb00.larc.nasa.gov>
Source record: 233261

> Also, is there any documentation writteen on how to program "Control Panel
> Extensions"?

I like cpanel but it doesn't like GEMINI! Also, I followed the
instructions for changing the SCRAPDIR and TRASHDIR values but it
doesn't seem to work. The trashdir gets moved, but that dern clipbrd
keeps appearing on a hard partition that I don't want things to get
scribbled on. Is this a known bug?

And my usual request:
1) Does anyone have any information on the TOS 1.4 patches for STOS
My STOS is useless right now. :-(

>advantage of all those colors on the screen at once...
>

I have two Spectrum animations: one of those desk toys with the little pendulum balls swinging (and reflections moving with them), and four atari color monitors each with a different moving display (one even has a vertical hold problem!!). I have no idea how they were done. The viewing program I posted to atari.archive (showspec.arc, I think I called it) has an option to show these animations. They appear to be mulitple spectrum pics with a sequencing file. If you do not have these animations, and they are not on atari.archive somewhere, let me know and I will arc and post them. These are two of the first demo's I ever got. Remember "Shiny Bubbles"? That one sold a lot of Atari's! The two spectrum animations are of the highest quality.

>dmb%wam.umd.edu@uunet.uu.net

Dave, these works are not commercial efforts!! Some of these kids are not even in High School yet, for cripes sake! Recognize these demos for what they are: great demoes written by pirating groups. The messages are programming challenges and boasts of great hacks. What the heck is "general purpose code"??? The general purpose of the Union demo is to amaze the eyes and ears, and create envy toward the members of the Union. Sounds good to me . . .

As for the demoes being useless, I for one and amazed by many of them. Very few folks leave my house without a glazed look in the eye and a new appreciation for computer graphics. I LOVE to show them to PC types. They sell Atari machines (and Amiga machines).

The only thing that scares me is: What the hell are we going to do when the little buggers hit the job market . . . . :-)

No problem, I do it all the time. I cannot detect any loss of resolution.
I do all my printing at school, and only use my little 9-pin to check
alignment (Pagestream allows one to lighten the density of a printout, so
I can check stuff fast). I print PS to disk, then put it on a floppy and
lpr it on a NEC (or Laserwriter, they both work). I don't know about the
>300dpi thing, if you find out please email or post. Oh, by the way, there is
no conversion, you just load them straight in.

If you place text on an image, the only thing obscured is that which the characters cover. No box-like hole is created. You can define this precisely, using other backgrounds as well.

I tried go-up using a mono-emulator and found that it was unplayable (too slow and jerky). However, Broderbund has released Lode-Runner for the ST through a French company called Loriceil (sp?). I played it on a friend's ST and it was a very good port. Better sound and graphics by far than the old apple II vers. It also has a level editor and a cheat mode. If you liked the old LR you should call around to some software dealers who sell imports like:

COMPUTER GAMES+ (800) 443-8189
SIDELINE SOFTWARE (800) 888-9273

Facts is facts, and the fact is, most of the fun in programming (at least
from what I've seen) is in getting the program/function to work right, and
squeezing in as many "features" as possible. Careful design and a good
user interface take a back seat.

2776. Fastload of programs

Newsgroup: comp.sys.atari.st
Date: 1991-04-07 10:40:20 UTC
From: HOPPET@tubvm.cs.tu-berlin.de
Message-ID: <91097.124021HOPPET@DB0TUI11.BITNET>
Source record: 233284

I am interested to speed up the program loading process on my atari
and I have found the assembler source of `fastload' on atari.archive.
But unfortunately I'am not experienced in assembley programming of
68000 nor do I have an assembler program available. Is any body
out there who has compiled this program and who could send me
a corresponding `.prg' file?

As I have noticed from the source code, it seems that `fastloading'
is higly site dependent. I am still working on TOS 1.0 dated 02/06/86,
thus I would appreciate if somebody could send me an `error free' fast-
loader for this old TOS.

Please respond by Email and thanx in advance

Thomas Hoppe

In article <40919@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
)
)These demos are great, but.. is anyone involved in creating the demos
)also involved in creating anything useful..?

Actually, many of them are (even if they were not at the time they
made the demo): A few examples could be The Exceptions, The Carebears,
and S.Y.N.C. (I believe TEX and TCB are working at Thalion GmbH.,
Germany. SYNC have written Audio Sculpture--we all know what that is,
don't we?)
Of course, there are even more people NOT working yet, since the vast
majority of these demos are written by youths less than 20 years old.

The simple truth about the scrolltexts is that everybody knows
everybody else in these circles, and the scrolltext is a good way to
boost your ego. For example, your friends in school might be impressed
if you in the scrolltext claim that you're trading pirated software with
13 famous cracker groups all over the world. I know, since I've got to
deal with a lot of people like this in the store, even if most of them
have Amigas. And you should see the ads for different groups' HQ BBSs
at Fidonet here in Sweden. "Always the Latest Warez", they claim.

Piracy on the ST is getting better here in Sweden I think (less of it,
that is ;-). On the Amiga things are getting worse, though. As an
example: When we recived the new game "ELVIRA" from Accolade noone would
buy it. Everyone had been playing it for months, they said. Compare
this with the Nintendo market: Whenever a new game is released, we have
already sold all the cartridges we expect to get, even before we get
them! Games won't be a success for a home computer until the CD-ROMs
are real cheap.

Hope I didn't tire you,
Daniel

Seems that'd be a better choice, at least to me...
You uld have either software emulation or hardware coprosessors to run
existing software.

2781. Apple StyleWriter with the ST?

Newsgroup: comp.sys.atari.st
Date: 1991-04-07 16:52:16 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <4721.27ff07f0@miavx1.acs.muohio.edu>
Source record: 233279

I've been reading about the new Apple StyleWriter, which can be had at our University for $420. I was wondering if anyone has any idea whether it will work with a ST? All I've seen is an ad, but its supposed to be 360X360, and uses TrueType. It doesn't have a built ASCII mode though.

>Dave, these works are not commercial efforts!! Some of these kids are not
>even in High School yet, for cripes sake! Recognize these demos for what
>they are: great demoes written by pirating groups. The messages are
>programming challenges and boasts of great hacks.

I know this is going to sound pedantic, but why should we applaud bad programming practices? OK, I'm impressed by the fact that M.C. Crakker or whoever can put 522 colors on the screen, but I just have a hard time giving praise to these folks, because if they continue to write things that rely on hardware ideosynrcsies and internal TOS variables they will cause endless headaches for everyone when they do release commercial software. The Care Bears' sample sequencer recently posted is a perfect example. That program is a complete disaster as far as "coexisting in harmony with the system." People don't WANT a file selector that has little stars flying around the screen. People don't WANT to have to run the program off floppy, and put up with the thing crashing all the time. It's great that they managed to get 4 digitized samples playing simultaneously. I can tell you from experience that's NOT easy. But without some attention paid to good programming practices and "the rules," the program is useless, IMHO. Ask Allan Pratt what he thinks about programs that rely on "undocumented features" or circumvent GEMDOS and use their own floppy-disk handling code...

I am NOT trying to say that these programmers are not good; on the contrary many of them seem to be very talented (especially if they're as young as you say), but the last thing the world needs is a bunch of people writing nonportable, non-fool-proof, and non-bullet-proof code. The irony is that it's not that they _can't_ make robust, portable programs. Being such programming whiz-kids, it should be no problem. They just don't care. That's the part that I wish would change.

> What the heck is "general
>purpose code"??? The general purpose of the Union demo is to amaze the eyes
>and ears, and create envy toward the members of the Union. Sounds good to
>me . . .

Well, at the very least, "general-purpose code" in the case of a demo means, "code that will run on all ST/TT machines". (Within reason. If you write an STe or TT only demo, that's another matter.)

As I've pointed out before, there are many, many demos that don't run on my machine because my monitor can't handle the UNDOCUMENTED forced change to 50Hz. Just sour grapes, you say? Nope, I just wish that these people would spend a little more time figuring out how to do things the right way, rather than hacking the OS to pieces.

Trust me, most things like screen interrupts that put 512 colors on the screen CAN be done such that the "great hack" will work on all ST's.

As for "envy," on the one hand you're saying that I shouldn't expect too much of these people because they are high school kids, but on the other hand you tell me tht the point of the demos is to make me impressed with their programming genuis. To me this is similar to saying, "There's a really incredible ice skater I know. She falls down a lot, but if she can keep going she can do these _amazing_ jumps."

A lot of people consider Darek Mihocka to be a "whiz-kid," and he was writing code when he was in high school too. My impression, however, is that he follows "the rules". He writes great stuff (the 8-bit emulator is certainly an impressive "hack"), but still manages to make sure it's robust and TOS-version independent. My point is that I am personally more impressed by something like Quick ST than the Union Demo in terms of programming ability. Quick ST isn't showy, but it's a great hack, and it works on every ST/TT in creation. OK, so Quick ST is a commercial product. So what? There's no reason those demo people couldn't write commerical-quality software too. They obviously have plenty of spare time, and it would probably help them pay for college!

Again, just my opinion.

>The only thing that scares me is: What the hell are we going to do when the
>little buggers hit the job market . . . . :-)

Pray that they have learned to write portable and robust code before you have to use one of their programs. :-)

That all said, I'm really not trying to flame the demo authors. Poor programming practices and non-portable code just get to me. Maybe there's a traumatic expereince involving poor programming in my past. :-/

Enough o' my raving...

2783. ZEST demo in atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-04-07 19:13:19 UTC
From: pyr579@oz.plymouth.edu
Message-ID: <1991Apr7.191319.25814@oz.plymouth.edu>
Source record: 233282

Hey netters,

I just downloaded the ZEST demo for the ST from atari.archive and it
is great. Embossed windows with ability to background utility windows and
do something else. It was a demo inspired by the NeXT computer according
to the author. You need monochrome, but if you are running color, grab
EMULA which is a monochrome emulation (that actually works well). I was
very impressed by the demo, whoever did it, if you are reading this, please
continue!

One word about EMULA, make sure you put this on a floppy AUTO folder
not your Hard drive, it does some funky stuff that will probably conflict
with other AUTOboot prgs and perhaps fry your Hard Drive.

Have Fun!!!

Thanks to all those who responded to my questions about
.IMG files and Pagestream/Postscript.

This has been a real help.

Another Question: If i save a music score of several pages in
length to an .IMG file and export it to Pagestream, does
Pagestream know how to handle a raster file of this size?
Does the score automatically get appropriated to multiple pages
in the DTP?

Thanks

cheers!

> WOW! You're not the only one who's looking for such a program for
>VAX... Whoever has these programs could kindly mail me too, or simply
>post a message to the net and perhaps u/l these programs to atari.archive
>(even though they're not for atari computers)...

The VAXVMS directory on SIMTEL contains the following two
files:

"PD1:","<MISC.VAXVMS>","RZSZ9103.README",1,574,7,910329,""
"PD1:","<MISC.VAXVMS>","RZSZ9103.TLB",1,175104,8,910328,""

These appear to be the latest versions of Chuck Forsberg's rz/sz for
VMS (I presume they include rx/sx and rb/sb as well). The .TLB file
seems to be some sort of VMS library file. The .README says:

To extract files from rzsz.tlb, issue the following DCL commands:

$ LIB/EXTRACT=EXTRACT_TLB^COM/OUTPUT=EXTRACT_TLB.COM rzsz.tlb
$ @EXTRACT_TLB rzsz/exit

I'm not sure if this will give you working copies of rz and sz, or
source which you'll have to compile yourself. Probably the latter;
detailed instructions are likely included. Anyway, fetch the file
from the archives and give it a try.

(The ftp address for the SIMTEL archives is wsmr-simtel20.army.mil;
login as "anonymous" and give your full account name as password. If
you're not familiar with the archive, it's probably a good idea to
read some of the help files in the top directory. I think there's a
help file specifically pertaining to ftp'ing from a VMS machine; read
it carefully before proceeding, or you'll almost certainly end up
fetching the file in a format you can't use. To get to the vms
directory you need to type `cd pd1:<misc.vaxvms>'.)

Hope this helps, BBB

2787. ZModem For The Vax Available

Newsgroup: comp.sys.atari.st
Date: 1991-04-08 00:33:22 UTC
From: vanleejf@udcps3.cps.udayton.edu
Message-ID: <1991Apr8.003322.27599@udcps3.cps.udayton.edu>
Source record: 233309

Well, for all of you that asked for it, ZModem for the Vax will soon be
available from atari.archive. It was uploaded as SZ.EXE and RZ.EXE and they
are both the executable code. You need to set up a logical symbol like
this (for both files) and put it in your LOGIN.COM file:

```
$ RZ :== $UTIL:RZ.EXE
^^^^
\
whatever directory you put it in
```

I would have just told you where to get it, but I can't remember. Oh, well.

>"sophisticated" than a lot of the 40-pin FDC's you'll find. I don't know if
>$25 is the best price, but don't let the smaller pincount fool you.

>dave allen, colorado springs

To answer my own question, the best place that I found to get the 1772 is
BEST electronics in San Jose, Ca. I talked to somebody named Brad. He was
very helpful and actually talked to me for a while about my problem and even
made suggestions etc.. The number of couse can be found in several of the
Atari Mags.. but I have it right here: 408-243-6950..

BTW, I spent some time calling around about this IC and Western Digital no
longer manufactures it (even though it is listed in the 1991 IC master).
There is another company that is going to be putting out some compatables soon,
but the price was even more than $25... I think BEST's price was $18 and some
odd cents.. but don't quote me..

[previous statements about British PgC cpu series and influence on Mot./Intel]

>From: plinio@turing.seas.ucla.edu (Plinio Barbeito)
>It would be more fair to call it a monopoly if Motorola's prices were
>unreasonable (like intel's).

I would contend that their decision to not license their 030/040 and 386/486 architectures to other companies was very short-sighted. If Motorola had allowed their chips to be second sourced, especially with Japanese companies like Toshiba and Hitachi, they would have attained a much larger share of the market. Distributing the development of the cpus would have allowed Motorola and their licensees to debug and produce their designs much faster. Instead, the 040 arrived more than a year overdue and does not meet its performance expectations. As for Intel, from what I read, they seem to be simply unscrupulous with their licensees and I guess it would have been out of character for them to have an open architecture.

[PgC 7610 specs and availability...]

>Promising 80 MIPS by Feb. 1992 for $40 in (large volumes, I assume)?
>Sounds great, but it is just that -- a promise. Has intel ever made
>good on the promise that its i860 would run at 50MHz so that the 150
>max MIPS figure hyped by the press could come to light?

Someone posted that there was an article on the PgC chips in the international edition of Byte. It is supposed to be in the March '91 (not '89) issue and perhaps someone from Britain might post more information.

>Other questions to be resolved: how efficiently would the processor
>emulate a 68000... We wouldn't know all of this until the machine and
>emulation software were inplemented.

The following information about a similar processor might provide more proof of the viability of the PgC design: Teraplex (Champaign, IL) developed a 32 bit processor with a 128 bit instruction word (PgC 7600 uses 96 bit instr.). The Teraplex cpu does not have microcode or decoding circuits so it uses the the first 64 bits of the instr. word for hardware control, while the second 64 bits are the instruction operands. The instructions are very primitive so that it is capable of mimicking other processors. Actual systems built with this MISC (minimal instruction set computer) execute MS-DOS programs at about 4.5 times the speed of a 33Mhz '386. Although it does not have a FPU, the Teraplex 32 bit CMOS design is about as fast as a MIPS R3000 with an FPU. Other systems based on the MISC are running MIPS and SPARC programs and the company is also investigating running Motorola 68000 code.

Teraplex hopes to have commercial workstations and desktop computers based on the chip, by the fourth quarter of 1991. Refer Byte, Nov. '90, pgs. 19-20.

>Also, a lot of fast cpus will be introduced in this year of 1991, so
>that 80 MIPS (whatever that means in real terms of performance) may
>not seem as fast by comparison in one year. And 1993? Well, in
>computer years, that's ages hence. By then, the 68050 may be a more
>familiar sight...

It's hard to make predictions, but it seems certain that one of the dominant OS running on the new processors will be UNIX and the SPARC RISC was designed to run it optimally. Also, Sun's decision to have an open architecture is resulting in a flood of systems based on the SPARC chip set. A partial list of companies introducing SPARC systems are Northgate, Chicony Electronics, CompuAdd, Hyundai, Tatung, DTK Computer, Opus, RDI/TriGem, DCM Data, Mars, Sampo, Solbourne, Meiko World, ICL, Solarix, Toshiba, Twinhead, etc... It would appear that the SPARC-UNIX combo will mirror what happened with the MS DOS-INTEL systems; you will be able to get a very powerful system, very cheap.

Atari will have a hard delivering an '040 system that will be competitive with the SPARC-based systems. If the specs for the PgC and Teraplex chips hold true, then it would seem to me that Atari could have an amazing machine that would be capable of running programs faster than the target system!

>From: Bob_BobR_Retelle@cup.portal.com
>Golly.. Lenonard Tramiel has already stated that Atari will never use
>the 68040 (I think it was at the Glendale AtariFest last year..?), so
>why worry about it..?

I was reading some of the old Znet and STreports on Freenet (thanks to the people who upload them) and Alwin Stumpf of Atari Germany supposedly said in an interview that they would use the 68040 if its price were reasonable. Is Leonard Tramiel head of R&D? I remember reading an article about a guy name Shiraz Shivji. Is he still around at Atari?

I dloaded RUFUS from atari.archive sometime last year and only recently bought G+Plus so I could try it out (RUFUS needs GDOS). However, I am having problems with it. First, I have the terminal protocol set to VT100, but I call up the University machines and the screen won't scroll. It gets to the bottom of the screen and all the text disappears below the last line. Also, the text that comes back from the mainframe is all junk! I have the settings done the same as Uniterm but it's like RUFUS uses its own character table! Anybody had the same type of problems with RUFUS?

Its not worth it.
If You want to replace the stepper motor, You would have to readjust it
for the tracks beiing compatible with other drives.
It is impossible to do this without special measuring equipment
including a special disk to check the alignment of the tracks.

You should get Your drive replaced on warranty (it came with a warranty,
right?).

There is a GDOS clone at atari.archive called AMCGDOS. It's from Germany, I believe. Actually, I'm pretty sure it's at a.a; I think that's where I got my version. So, those who want to try Rufus don't need to purchase G+Plus, although G+Plus is an excellent product.

There is one at funic.funet.fi in directory pub/atari/comm (or telecomm).
Someone could get it and put it in atari.archive, and also check my
translation.

Hi,

After somebody told about the Okami shell, I have seen a lot of
questions where to get it.
Yesterday I found this shell on a local bbs here ("Dutchman").
As it is quite large (200k compressed) I will not post it. As soon as
someone tells me how to MAIL it to atari.archive, I will send it. (I
can not use FTP!)
So if someone is interested, please email.

Message-ID: <hess.671117698@rospc1>
Source record: 233334

Hello,

I just got the GNU GhostScript sources, but I`m not so good at porting large software (about 1,5MB c source). Was anyone successfull with this? Could you then send me the complete Interpreter (without fonts, they aren`t to be ported I guess) or just the right Projectfile with the needed changments to the source?

Thank you

Hauke Hess / University Hamburg / Germany

2805. Atari for Auction

Newsgroup: comp.sys.atari.st

Message-ID: <407@platypus.uofs.edu>
Source record: 233304

Ok, here's the story: I have an Atari ST that I no longer need, so I will be auctioning it off here. Bids will be taken from 4/8/91 through the 22nd. The highest bid, of course, will win. If the highest bid is a dollar, than the system is yours for $1!. I will post updates on the bidding every few days to keep you all informed as to how things are going. By now, you're saying, all right already, what's the package. Well, here goes:

Atari 520ST upgraded to 1Meg RAM
Indus double-sided drive
ComputerEyes color digitizer
Color Monitor
Monochrome Monitor
Mouse
INDUS SCSI hard drive controller (w/software & cable, but no drive)
A double (360K)/Quad (720K) 5 1/4" drive (great for IBM emulation)
A lot of software (mostly games, which I dont feel like listing.)

So let the bidding begin!

2807. TOS 2.05 bugfix

Newsgroup: comp.sys.atari.st
Date: 1991-04-08 15:41:45 UTC
From: larserio@IFI.UIO.NO
Message-ID: <CMM.0.88.671116414.larserio@kvart.ifi.uio.no>
Source record: 233303
Body handling: Inline uuencoded payload not displayed: tos205fx.arc

While testing out my new MEGA STE i discovered a nasty bug in one
of the Xbios routines (I can't understand why no beta-tester has).

The XBIOS 5 call setscreen(logadr,physadr,resolution)
is used to set screen adresses and change screen resolution.

However, calling setscreen with -1 as resolution doesn't change
the current resolution. On monochrome many programs still call
the setscreen function with 2 (monochrome) as resolution and
this works OK on older ST's, BUT on the MEGA STE's TOS 2.05
strange things happend :-(

The routine does NOT wait for vertical blank as it i supposed to
but resets the video in the middle of the screen, causing the
picture to wrap around the left edge of the screen in 50% of
the cases. This does not look good (you get the edge of the
grapic screen in the middle of the monitor screen :-)

To get around this problem I have made a VERY small program that
hooks on to the XBIOS 5 if in monochrome, and always sets the
resolution parameter to -1 (no change). Then things work OK !!

I would like an offical comment from Atari Corp on this bug !!!!
How i the world could this pass through the beta-testing ????
In only one day I found 10 programs that goes mad because of it.

> transfer data from the notebook/pad into a regular ST as well.

Nope, it's bidirectional - but not exactly the way IBM ports
are (which is partly why Portfolio code to transfer to PCs doesn't
work on STs). I should know, my dear departed 520 got me my BS, as it
ran my Armatron for Senior (EE) project. The ST sent the arm
commands, and the arm sent back signals when it hit its limits of
motion - all through the parallel port.

I did a port quite a while ago and it runs on a few German sites. It
can be used in a slightly modified Mercuy-UUCP enviromnet. It's not
available thru FTP yet, but I guess I'll put it on a German FTP host RSN.
I'll post detailed information when it's on available.

Look at forwiss.uni-passau.de (/pub/atari/tex-3.1). There you will find
an implementation of TeX-3.1 for the ST and showdvi, a previewer for
DVI files on various ST screens.

2817. Notebooks: SO there!

Newsgroup: comp.sys.atari.st
Date: 1991-04-08 21:59:10 UTC
From: mc4c+@andrew.cmu.edu
Message-ID: <0c0CSim00UhBI0qUIv@andrew.cmu.edu>
Source record: 233322

For all those out there who are convinced that TRH is the Word when it comes to the notebook market, and that Atari knows what the hell is going on on the other side of their closed eyelids, please read on:

Zeos Notebook PC
12mhz 286, 2"x12"x10", 1 meg RAM, backlit VGA, and ext. vid. port, 20 Meg HDD, 1.44 meg floppy, $1995.

Compaq LTE
20MHz 386, 7 I/O ports, 30 /60 meg HDD, 3 meg RAM, 1.44 meg floppy

Dataworld NS 320SX
386sx, VGA with ext. vid., 2 meg RAM, 20 meg drive

Others include the Northgate slimline, and the Austin sx, with standard 2 meg RAM. These machines have stated weights of under 7 lbs, including the battery charger. I doubt the notebook ST wieght includes the charger. Without the charger, they weigh in less than 6 lbs. Granted they weigh a bit more than the ST notebok, but do NOT tell me that they are figments of my imagination, or that there are no machines out there with both a hard drive and a floppy, as the guru TRH has stated. There are others that are lighter, and are closer to the ST notebook, but I have better things to do than to reread piles of magazines just to vindicate my position against the cries of the ignorant. I think I'll stick with the STacy for a while. Dog as it is, at least I can use it easily enough. And from the sounds of things over the Pond, we won't be seeing the notebook for atleast another year and a half, if not longer, anyway. (Told you so.)
Sorry about no more constructive criticism, but I came to the realization that as great (and, most importantly, feasible) my *dream* machine is, no one at Atari is listening to anything but there own shallow breathing. Too bad. They still have some glaring oportunites to take over the US market. But not as long as their philosophy is "Power without the Power". Maybe later I will have some more constructive comments, but for now, there seems little point. Prove me wrong Mr. Hall. Prove me wrong Atari. I dare you.

Screen won't scroll? That's odd. I have never seen that...
Rufus uses character table similar to German keyboard... That's bad!
Set it so that it uses only 7-bit characters. It usually works.
And you may have the screen-size setting wrong. Try 80x24.

Hope this helps a bit.

I'm using a version of smail that has been, in my opinion, finished for quite a long time. However, I didn't port it. The people who did the port have not released it for distribution, so I can't pass it around. Sorry.

The program also depends on the existence of several related programs (uucico, lmail, email, etc.) that also have not been released.

I wish I could be more encouraging, but if the program I'm using is the one you've been waiting to see released, I'm afraid it's simply stuck in limbo.

The delays had dragged on so long that I had stopped looking for it. But when I stopped by my dealer today to typeset the newsletter for the Minnesota Atari ST user group, I finally got to use a genuine production-model TT030.

So long as I stuck with ST High resolution, the TT was happy with PageStream 1.8. Higher (TT-only) resolutions produced bus errors and, in one case, an ``Illegal AES call'' dialog box. (One operation in 16-color TT mode locked up the machine.) Presumably these bugs are known and will be fixed in PageStream 2.1, which is said to be only weeks away from release.

The machine was clearly faster than the ST. I didn't use it to lay out the newsletter, just to drive an SLM605, so I can't offer any details.

The Mega STE also was in stock.

2827. Terminator Request

Newsgroup: comp.sys.atari.st
Date: 1991-04-09 06:57:42 UTC
From: sean@ccwf.cc.utexas.edu
Message-ID: <46902@ut-emx.uucp>
Source record: 233325

I'm not certain, but ... I assume thoriginal Tos1.0 on floppy is
considered pd. If so, could some one please post this to Terminator?
I've discovered some programs tht do not work under Tos 1.4 and wish
to try booting first with the old Tos.

No flames if this sounds foolish (wont the internal 1.4 over-ride the
software 1.0?), but some in net land once told me that this tactic
fixed his problem.

Thanks in advance,

Sean Sterling Foiles / Univ. Texas Comp Sci Grad / sean@happy.cc.utexas.edu

Hi,

I have uploaded the okami shell (okami12.lzh) to atari.archive today.

As for the enormous amount of email, I guess a lot of people want to
have this shell.
Thanks to everyone who replied to my previous posting.

Please stop mailing me about the okami shell now, otherwise my mbox
will explode :-)

2830. BackupST: Looking for beta testers

Newsgroup: comp.sys.atari.st
Date: 1991-04-09 11:22:19 UTC
From: fred@cv.ruu.nl
Message-ID: <fred.671196139@prisma>
Source record: 233332

Hi,

I am looking for users of the program BackupST. I have collected the
bug reports and wish lists for a while and BackupST 1.22 is the result
of it. If you are a current user of BackupST I invite you to become a
beta tester of the new program. The documentation is not updated yet,
so if you are a new user, you better not become a beta tester.
The following is a brief list of the news features/bug fixes in the
new release.

1. Single program instead of 2 programs. Bfront is disapeared. The oply
program left is BackupST.prg. The 'ttp' interface is gone too.
2. Bug fix: files which were located on a disk boundary had a high chance
of being damaged.
3. Bug fix: The number of files/directories reported at the end was double the
actual amount.
4. Screen flipping: Is improved. It should work now on all monitors.
5. Archive bit is set after the backup is done. This means that if you abort
the backup process half way for some reason, the archive bit is not
effected.
6. 'q' works in more. This means that you can stop a listing when you have
found what you are looking for.
7. List outputs to screen, disk or printer.
8. The welcome scene is changed somewhat.
9. Sound can be enabled/disabled. Some people found the bell annoying.
10. '$' in filename bug fixed. Not a lot of people acutually reported this
bug. If a special character (^$.*[]) was present in the filename, it
caused enless loops in some cases.
11. You can specify files/dirs to be skipped. Also wildcard are supported.
(e.g. *.bak *.o d:/tc d:/tex etc.)

If you want to become a beta tester, please mail me. If will send you
the program by mail. Between 5 and 10 testers would be great.

2831. Atari for Auction: Update

Newsgroup: comp.sys.atari.st
Date: 1991-04-09 11:48:55 UTC
From: meo3@jaguar.ucs.uofs.edu
Message-ID: <409@platypus.uofs.edu>
Source record: 233351

Ok, here's the first update on the auction. I wasnt going to enter this
so soon, but maybe it'll stop the flood of $5 bids to my account :)

Our highest bid after 1 day: $200 for the complete system.

Other offers worth mentioning: $75 for the color digitizer.

Now, for those of you who missed out, now's your chance to send me a bid
on the following system. The highest bid as of April 22 takes the lot.
To recap, the package is:

Atari 520St w/1Meg & Mouse
Color Monitor
Mono Monitor
Indus DS/DD drive
5 1/4" 360K/720K drive
Color Digitizer (ComputerEyes)
SCSI controller card w/ cable & software
Lots of software (mostly games)

Mike

2832. TT questions

Newsgroup: comp.sys.atari.st
Date: 1991-04-09 12:24:41 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <23274@know.pws.bull.com>
Source record: 233335

As a TT user, life is pretty lonely right now. I keep posting questions on the net about TT compatible software but I do not get any responses.

If anyone has an answer to any of the following, please post a reply:

1. Is there a terminal emulation package (VT100/240,etc) that works on the TT in TT screen modes (Flash and Uniterm have to be in ST screen mode).

2. Do any of the PC emulators work on the TT (ATOnce, ATSpeed, Delta-Modul, SuperCharger). I want minimum AT emulation but would prefer 386 performance.

3. When will Pagestream be fixed to work on a TT (Calamus works in ST screen modes and sort of works in TT screen mode).

4. Has Signum been updated for the TT? (Tex works well but I hate the command interface).

5. NeoDesk 3 requires a warm reboot to change rez on the TT, thus making it unusable because I have to change rez often. Will this be worked around in the future.

6. I spoke with the developer of Revolver and there is no plan for an upgrade to the TT (ST versions did not sell very well). Pity, the ST/TT without Revolver is a drag. Anyone else working on a TT task switcher (I could retire before UNIX is ready).

7. MVG works only in ST high rez; any plans for a TT screen mode fix?

8. Turtle and Megamin will not work on the TT; any plans for an upgrade?

9. Will EasyDraw be recompiled for the 68030/68882; it would scream!

2833. atari.archive: uploaded Mercury UUCP by Rodney Volz

Newsgroup: comp.sys.atari.st
Date: 1991-04-09 12:31:56 UTC
From: ralph@laas.fr
Message-ID: <RALPH.91Apr9143156@orion.laas.fr>
Source record: 233333

I have just uploaded mercbin.lzh to atari.archive. I picked it up on some Finnish ftp site. It seems to be a very recent version (1.18), since the readme is dated Sat Jan 12 15:45:16 1991. If someone has the corresponding source, maybe they could upload it, too.

Here's the release.src file:

Stuttgart, Sat Jan 12 15:10:42 1991

Hello dear friends!

This will be the last time that I'll have to care about Mercury UUCP - at least I hope so. Like I said to or three months ago, I've decided to release the sourcecode of Mercury UUCP. Now, here come some words about its status.

Mercury UUCP is Shareware. That means, you are free to copy the stuff, pass it to friends, distribute it via any kind of network and install it on as many machines as you like. Otherwise it means, you are *not* allowed to sell it, or to gain money by distributing it. Also, you are allowed to install the package on your machine, but you are expected to send a shareware-fee to me, if you use it steadily. The amount of this fee depends upon the way you use Mercury UUCP, and who you are. See the file "README" for further informations.

If you compile and/or change the source of Mercury UUCP, please alter the version description (defined in "defs.h") before. DO NOT just change the version number!

Version "1.18" should become "1.18.sf.2" if it's the second
^^-----+
| |
release of a hacked up version by Steven Falken. Okay? Thanks.

Mercury UUCP is the first program I wrote in C, and you can see that when looking at the code. When I started writing it (with megamax C), I didn't even have a C-library, so I had to write everything on my own. I learned very much by doing so, but I wonder whether anyone other than me will manage to compile the source. :-) Some newer parts of Mercury UUCP are to be compiled with Mark Williams C. They should be quite okay.

Thanks to all those who helped me while developping the stuff!

Have Fun,
-Rod

2835. GEM source code

Newsgroup: comp.sys.atari.st
Date: 1991-04-09 12:36:34 UTC
From: hofmann@cbnewse.att.com
Message-ID: <1991Apr9.123634.12778@cbnewse.att.com>
Source record: 233336

Awhile back a request was made for people on the net to release
examples of working GEM code for use as a tutorial to those trying
to learn how such code works. A good idea, but I have one question.
Aren't the include files that come with a compiler proprietary?
That being so, I can post the source (set to compile with Prospero C)
but not the include files. That would not be all that helpful.

>could send me?

Quite some time ago I have written a program for the 8bit to do
right that, extract picture data from program disks. I did it by
copying sector after sector into the screen memory. This should
work on the ST as well if the picture data ist stored in bitmap
format. Wont work of course with compressed pictures. In this case
your program could scan the disk for magic numbers used by the
various picture formats and extract the following data to a seperate
file, then use guck or a similar multi-format browser to see if you
actually caught a picture.

The SuperCharger works.

>4. Has Signum been updated for the TT? (Tex works well but I hate

Yes, there is a TT update. (ST-High only!)

Try MultiGEM from Maxon in Germany. It's a MultiFinder-clone for the
ST which will soon be released for the TT, too.

>9. Will EasyDraw be recompiled for the 68030/68882; it would scream!

Why do you think so? I don't think they're using many floating point
ops in Easydraw, do they? Better get some TT RAM and let it run there;
this gives you 20 to 40 % more performance. You might also move TOS
into fast RAM which makes for another noticeable speed boost.

Please don't. If you do upload it, we won't put it up for download unless we get explicit approval from Atari to do so. We already got it trouble with them for having TOS 1.4 up for download, we don't need any more problems.

The tos-up-for-download incident prompted us to stop allowing people to download things directly from the "new" directory. Now we have to review everything before it gets made available for retrieval.

Finally, we're atari.archive.umich.edu first and foremost. The fact that you can reach us via terminator is just a coincidence.

2842. 720 + 360 == 2* 360 ??

Newsgroup: comp.sys.atari.st
Date: 1991-04-09 15:42:19 UTC
From: raford@oracle.com
Message-ID: <1991Apr9.154219.10099@oracle.com>
Source record: 233394

A friend recently replaced his internal 1/2 meg drive with a 1 meg drive. He threw out the old one, so I thought I'd use it as a second drive on my STM (no internal drive). I made up a lead, but as soon as I connected the new drive, BOTH of my drives started acting as single sided. Anyone understand this? It must be possible to have one of each, since lots of people have 1/2 meg internal drives and 1 meg externals on their STFMs.

Then again, we had to throw out a board full of electronics from his machine when we upgraded. Is this something to do with it? Could I use this? Will it allow me to have the 1/2 meg as B: (I certainly don't want one as A:!).

Alternatively, anyone got a cheap 1 meg drive for sale near London, England? Do PC drives fit?

Thanks for any help.

2844. FSM GDOS: when will it be real???

Newsgroup: comp.sys.atari.st
Date: 1991-04-09 17:48:50 UTC
From: <>
Message-ID: <1991Apr9.174850.16579@agate.berkeley.edu>
Source record: 233340

Question: When will FSM GDOS be out, and how will I be able to get it to print with a DeskJet 500?

Why: Because I need to know if I should shell out the money for the Migraph GDOS printer driver.

BTW, FSM GDOS exists in some form. I got a letter from Goldleaf (of WordFlair fame) that was printed on a SLM605 with FSM GDOS. It looked VEERY nice. I sense two possible bugs: 1) the spacing of the letters is not perfect, 2) the capital letters are blacker than the lowercase letters. These might just be bugs in the fonts. The 605's output is very nice; FSM's rasterization appears to be very good as well.

Another BTW, they used a Palatino or Palatino-like font.

Review: Wordflair II is very nice. Problems: as usual, it's slowed down by Atari's GDOS and VDI and AES; still not enough drawing tools; the screen bitmap is not buffered, so updates are unnecessarily slow; only one edit window; no word processor file conversion utilities. Assets: this is the only word processor of its kind on the ST (the object oriented model is perfect for modern document management; the only other program I have used like this is framemaker); it's faster than most other ST word processors which have half the features; comes with a graphics file conversion .ACC; has dictionary, thesaurus, and hypenation dictionary (all are based on digital Webster, so Goldleaf went outside for those modules); FSM GDOS compatible; pretty good database management which works better for mailmerge than the usual db-program-or-textfiledatabase + wordprocessor combination.

WF is geared mostly toward writing dynamic documents, that is, documents that will change over time, or change depending on who is supposed to read it. This is the opposite of most word processors, which are geared toward static documents like research papers and books (well, some can be used to write books). I will continue to use WordPerfect for some things, but anything with a table, graphics, or mailmerge will definitely end up on Wordflair.

Is it worth $125? Yes.

I'm kinda not surprised about this. To change from mono to color on the ST, the ST *usually* requires a warm boot.

However, I was playing with EMULA, which is a pretty good monochrome emulator, and when I changed from color (running EMULA) to mono, the computer didn't reboot!!! I was really surprised, and pleased. Now, if there's a program out there that does this for color mode, without EMULA, I'd really like to hear about it! Anyone know of one?!

Many people thought that Intersect was out of business and not coming back. Apparently, Revolver doesn't work with TOS 1.4 and up. Just curious, how did you get a hold of them?

What else can you tell us about MultiGEM? Price? Is it compatible with
TOS 1.4 and STe? Any plans for a North American distribution? Please
provide us with Maxon's address.

Is this the Smail that we all know and love that runs on UNIX boxes,
i.e. the mail delivery agent? If it is, then it's covered by the GNU
copyleft, so any version should be freely distributable.

I'd be interested in using this as the mail delivery agent when
running MINIX, as soon as I get UUCP for MINIX working properly.

2850. digicomposer uploaded to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-04-09 18:44:02 UTC
From: erlingh@idt.unit.no
Message-ID: <1991Apr9.184402.6232@ugle.unit.no>
Source record: 233350

I've just uploaded digicomposer to atari.archive.
It was sent to me from daniel@hexagon.se, and since he
doesn't have ftp access I uploaded it.
This is a PD-tracker that should also work on the TT.
Enjoy.

You are (wrong about this). VGA simply has 6 bits per primary color, for
a total of (2^6)^3 = 262,144 colors, with 256 palette entries. No tricks,
no horizontal-sync interrupts, none of that crazy stuff. On a monochrome
monitor, you get 64 levels of gray.

2854. HacMan II v1.15 available at atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-04-09 20:39:12 UTC
From: dmb@wam.umd.edu
Message-ID: <1991Apr9.203912.11911@wam.umd.edu>
Source record: 233352

Several people have been had trouble installing HacMan II of late. I believe all these problems are related to lack of sufficient disk space when extracting the archives. If anyone's been unable to get it working, please let me know. (If you've got 0-byte files, that's a sign that you need a bigger RAMdisk or HD directory when extracting...)

For those of you with single-sided floppy systems, version 1.14 had a file misnamed, thereby causing the game to abort instead of prompting for disk 2. That's been fixed in version 1.15, which can be FTPed from atari.archive.umich.edu:atari/newitems/hacmn215.arc.

Since this is a particularly annoying problem for SS floppy users, I would (once again) greatly appreciate it if people with access to GEnie, Compuserve, etc., could update the copies posted on those on-line services.

Sorry for any headaches the "bug" may have caused.

Thanks all,

Dave Baggett

> Aren't the include files that come with a compiler proprietary?
> That being so, I can post the source (set to compile with Prospero C)
> but not the include files. That would not be all that helpful.

Unless the Prospero people have lost their good sense, their
.h files should be interchangable with anybody else's .h files.
I haven't used Prospero, but I have looked at the manual, and
their GEM libraries seemed conventional.

Of course, you should post any .H files written for the application,
including .H files generated by a resource editor.

GEMFAST (for Sozobon, Alcyon and assembler) uses a single GEMFAST.H
file in lieu of the standard obdefs.h and gemdefs.h files. The
portable solution (on a system using GEMFAST) is to install
files bearing the standard names but consisting of the following
lines:

```
#ifndef GEMFAST_H
#include <GEMFAST.H>
#endif
```

If a lot of GEMFAST-dependent code starts showing up, it may be
worthwhile to write a GEMFAST.H file that #includes the standard
files and #defines fsel_exinput if your compiler lacks that
binding.

Indeed, it's only in the "International" edition, since it's a well-known
fact that Americans aren't the slightest bit interested in anything which
is happening in Europe.

The so-called "International" section of Byte is one of the many reasons
why the magazine sucks.

I've been playing the IMMORTAL on level 2, and have been stuck there for some time. I've got everything from the level-- killed the orc king and he told me his message. He is specific about "... three jewels ..." but I have only two and the stone. I would assume that there is some way to turn the stone into a gem to get to the next level, but I haven't been able to find out how to do it. He did say "... rock become floor ...", which could be a reference to the stone, but I dunno. How does one obtain that last gem? and BTW, has anyone been able to get back up to the first level? The instructions say "... move up to it [ladder] and you'll automatically climb ..." but I haven't been able to do it. (I wanted to do so to use the light & amulet on the stone to see if it would turn into the last gem). Also, has anyone been able to escape out of a pit trap by "gently rocking the joystick back and forth at an even pace?" Those traps always get me!

Thanx in advance,

Perry Pederson

I have been LaTeX'ing on my ST for about 3 years now, and have always dreamed of an ST program similar to Fig for Suns! But such a beast I have never seen, up till now!

I just downloaded from forwiss.uni-passau.de in the /pub/atari/tex directory a great looking file called texdraw.lzh. I unlharced it, and found that the majority of the document and program is in German.

BUT DOES THIS PROGRAM LOOK GREAT!! Do any of our bi-lingual net readers know if there are any plans for an English version of this program??
I only know that if such a beast exists, or is in the planning stage, many of us ST/LaTeX freaks would love it!! Anyone willing to check on this??
How about just an english version of the .rsc file??

Heck, this thing is so impressive, I may learn to read German just to use it! I'm talking one very slickly done piece of graphics/TeX tool here!

I ftp-ed rufes from atari.archive and downloaded it. everything runs
nicely, no problems w/ GDOS.
However I did notice that when I uploaded something with the
internal Xmodem or Ymodem, it does a disk access every kilobyte.
Needless to say, this is not good. Is there a way around this, or are
you pretty much expected to use the external Zmodem that is provided?
This may be in the documentation, but I'm many years out of practice
with German.

(BTW, you can't see an entire 80X24 screen unless you change the font
that it comes up in to something smaller. Then it all fits nicely.)

An interesting bit of trivia on Sundog is that it was originally written
for the Apple][(I saw it many years ago at the West Coast Computer Faire
in San Fran.). Sundog was written in UCSD Pascal.

I thought it was a fantastic game on the Apple][... grabbed it instantly
when I found that there was an ST version. Don't think I'll ever FINISH it
though, but its interesting to explore all those worlds!

>Hi All,
>
>I have just upgraded my 520STe to 2 Megs so I now have 2 1/4M SIMM's rattling
>about in a draw. A colleague of mine is working on a project at home and could
>use this RAM. So what I want to know is, what is the pin layout for these
>SIMM's.
I got this from Treavor Peacock somewhere over there in UK: Let me know if
it works!

```
---------------------------------

___________________ ___________________
| Bank 1 high byte | | Bank 1 low byte | === R90 CAS0HI
| CAS1HI and RAS1 | | CAS1LO and RAS1 | === R93 CAS1HI
------------------- ------------------- === R94 CAS1LO
------------------- ------------------- o RAS1 (solder thru)
| Bank 0 high byte | | Bank 0 low byte | === R91 CAS0LO
| CAS0HI and RAS0 | | CAS0LO and RAS0 | o RAS0 (solder thru)
------------------- ------------------- === A8
=== A6
/ === A3
9*33ohm--< === A0
\ === A4
=== A2
=== A5
=== A1
=== A7
----------------------front edge of board---------------------------------
```

The data in/out lines are connected on each chip, so this is the same as on a
SIMM, where they are already connected. The data lines are common between
bank 0 and bank 1, that is, the data line from the LSB on bank 0 connects to
the data line from the LSB of bank 1.

SIMM pinouts
=-=-=-=-=-=-=
PIN# Function. Note '*' means -ve logic.

1 Vcc = +5V
2 *CAS
3 D1 <-- Note, goes from D1 - D8, not D0 - D7. Makes no difference though
4 A0
5 A1
6 D2
7 A2

8 A3
9 Vss = 0V
10 D3
11 A4
12 A5
13 D4
14 A6
15 A7
16 D5
17 A8
18 A9 <-- N/C on 256k SIMMS
19 N/C
20 D6
21 *W
22 Vss = 0V
23 D7
24 *PRD <-- Not on all SIMMS, just pulled low. Best left N/C
25 D8
26 N/C
27 *RAS
28 N/C
29 N/C

>considered pd. If so, could some one please post this to Terminator?

I doubt it. If Atari think anyone wants something they usually put a price on it. I'm still waiting to hear if NEOchrome is PD or not despite PD libraries distributing it far and wide.

>I've discovered some programs tht do not work under Tos 1.4 and wish
>to try booting first with the old Tos.

This works for some things and not others. If a program relies on a bug or the way something is done by TOS 1.0 the it will work but if it relies on the location of undocumented locations it probably won't. Some games in the bad old days used to load at absolute addresses and will land on the TOS image in RAM.

>No flames if this sounds foolish (wont the internal 1.4 over-ride the
>software 1.0?), but some in net land once told me that this tactic
>fixed his problem.

Until you press the reset button (CTRL-ALT-DEL won't work of course) or switch off, your TOS 1.0 would be in control.

Speaking of texdraw.lzh, it is also available from atari.archive. The copy I downloaded would test out well, all the members would test okay, but the archive as a whole would finish with a CRC error. Lharc on Unix and Lharc version 1.02, 1.13, and 1.13.8 on my ST would all error abort. Only lharc 1.13 on a PC accepted this file correctly!

Are the ST/Unix version of lharc still bugged?

Lots of replies on a previous posting in this group, concerning problems
I have with my megafile 44 harddisk pointed out that I have to migrate
from TOS 1.2 to TOS 1.4, or use FATSPEED.PRG instead.
Since I prefer trying the latter option first, I would like to know where
I can get this program.
Someone mailed me it should be on some usenet-accessible board.
Can anyone mail me details about the full path (and type of info-server,
if appropriate) ?

Thanks a lot in advance everybody!

Dick.

MAXON Computer
Industriestrasse 26
D-6236 Eschborn
Germany

Warning concerning everything I tell you about MultiGEM: I know the
programmer personally, so my views may be biased. Take them with a
grain of salt 8-)

MultiGEM is something like a MultiFinder clone for the ST series. I
think it also runs on 1040STe and MegaSTEs, but I'm not sure. At CeBIT,
it had some problems with TT fast RAM, but I didn't expect anything
else for it was presented as a ST-only-product _at the moment_.

MultiGEM is a small AUTO folder program (eats up 30 or 40 KB in memory)
that lets you start up several applications simultaneously from the
Desktop (or from GEMINI). This is done by faking the AES into thinking
that those applications are in fact accessories. (Yes, this means that
you can't have more than 7 applications at one time, and that you have
to sacrifice ACC slots to start up applications.) The applications
multitask cooperatively following the standard GEM concept of giving up
control from time to time by calling the AES. All the major GEM applications
work. TOS program output can be redirected to a window, so they want mess
up other programs' screens, and TOS programs will even multitask this way!

If you click into a program's window, its menu bar is switched on and
displayed in the first line of the screen. If the program owns a
desktop, this will be brought to the front, too. Alternatively,
you can switch applications by clicking into the Desk menu where
you find the names of the currently running applications.

Some programs won't multitask properly. One of them is SIGNUM. If you
start it up and click into its "window", windows from the desktop
beneath will show up and mess up the display. This is because SIGNUM
doesn't do proper GEM output. In these cases, you can force MultiGEM
into singletasking mode. Some other applications like to eat up
the complete memory available. MultiGEM can fool them during startup
so that they will leave enough room for other programs.

MultiGEM has been presented at CeBIT in March. It is not yet a real commercial product as I understand. I heard rumors that it might be available RSN, but I can't say for sure.

There will be a special TT version, but I don't have any details on it.

>Any thoughts on doing it would be appreciated.
>

You know, Mac is very "dot-oriented", so you would need to make/get aspecial
driver for it. And it would also reserve the serial port, so no modem...
This is because ImageWriter prints everything as a bit-image and mac does not
have an actual centronics-port, both printer and modem ports are serials.
So you can print pictures quite easily, but text does need a very special
driver.

darius@edm.isac.CA (Darius S. Naqvi) writes ...]

> Is this the Smail that we all know and love that runs on UNIX boxes,
> i.e. the mail delivery agent? If it is, then it's covered by the GNU
> copyleft, so any version should be freely distributable.

The program is Smail 2.5, originally by Christopher Seiwald. It accepts data from standard input, processes the headers as necessary, looks up a mailpath, and pipes the result to either a local delivery agent (lmail) or to uux for execution of rmail on a remote machine.

The Smail source code that I have bears neither copyright nor copyleft. Smail 3.x, which is a different program entirely, may be covered by the GNU agreement. I don't know.

Smail is written with many assumptions about the nature of the underlying operating system that are not valid for TOS. Several people had to invent some clever work-arounds to compensate for the single-tasking nature of TOS, cover for some rather obscure bugs in Atari's operating system, and resolve other system dependencies.

Some of those work-arounds involve altering the Smail source code, but most of them involve writing a C library to supplement dLibs. That library hasn't been released, and since it's not mine, I can't be the one to release it.

Somebody else has mentioned a version of Smail for Rodney's Mercury UUCP. That might be worth looking into. There's also an MS-DOS port of Smail (ftp wuarchive.wustl.edu) that might be useful for people interested in whipping up their own TOS Smail.

(Actually, after using Smail for quite some time, I'm not convinced that it's an appropriate tool for the average ST-based mail system, which is likely to be a leaf node.)

> I'd be interested in using this as the mail delivery agent when
> running MINIX, as soon as I get UUCP for MINIX working properly.

I think that for Minix you should compile the standard Unix Smail.

2886. Re: Notebooks: SO there! (long)

Newsgroup: comp.sys.atari.st
Date: 1991-04-10 17:10:00 UTC
From: bright@ccu.umanitoba.ca
Message-ID: <1991Apr10.171000.17022@ccu.umanitoba.ca>
Source record: 233385

[This is a bit tacky, but I'm going to do it anyway, because of the obnoxious tone of the article I'm following up.]

I've been carrying on an email discussion with Mark Choi re: his position w.r.t. the forthcoming Atari notebooks. In a letter of April 3 I suggested that he had something different in mind by "notebook computer" than TRH did, and that a good deal of ill will could have been avoided if this had been made clear at the outset:

mc>> I do not mean these luggables when I refer to these machines, I mean
mc>>what I stated, around the size of a piece of paper, and weighing less
mc>>than 7 pounds, including battery, which lasts about 3 hours.
bb> ^^
bb>
bb>Yes, I know this is what you meant. This is also what I was referring
bb>to. "<= 7 pounds with a reasonably small footprint (lapprint?)" is
bb>becoming/has become the de facto definition of "notebook computer",
bb>for no very good reason other than that the editors of various PC mags
bb>are enamoured with full-featured semi-portable machines, and 6-7
bb>pounds is about as light as we've currently got in this category.
bb>
bb>I suspect that a lot of the recent hostility between you and TRH could
bb>have been nipped in the bud if it had been made clear that you were
bb>relying on this definition. TRH's view, I think, is that a 7 pound
bb>machine which requires lugging around an extra 3 pounds of batteries
bb>in order to be useful is too heavy. This is also my view.

In a letter of April 3 Mark replied:

mc>Actually, the definition of a notebook computer is one that is the size
mc>of a notebook. In specific, the machines about which I was speaking,
mc>were smaller than the Atari, about the same weight, I would guess (in
mc>the 3 pound range), and still included the "extra" features, with a
mc>batterlife of 3-4 hours.

To which I replied (April 4):

bb>I don't suppose you'd actually care to name some of these machines
bb>about which you were speaking? Smaller than 8-1/2 x 11, less than 1"
bb>thick, about 3 pounds, with built-in harddrive, 1.44 meg floppy, and
bb>maybe some other stuff (a VGA port, I guess; not much of a space/
bb>weight consideration, but a definite power consideration as TRH
bb>noted). I think you've got a pretty good imagination. Sounds like a
bb>nice machine, but it doesn't exist; the only machines that currently
bb>come anywhere close are in the 7 pound range.

Mark replied (April 5):

mc> I will get you a list of several machines that fit the description
mc>after I go home.

I haven't received any further email from Mark. Which brings us to the subject of today's post. In article <0c0CSim00UhBI0qUIv@andrew.cmu.edu> mc4c+@andrew.cmu.edu (Mark Choi) writes:

>For all those out there who are convinced that TRH is the Word when it
>comes to the notebook market, and that Atari knows what the hell is
>going on on the other side of their closed eyelids, please read on:
>
>Zeos Notebook PC
>12mhz 286, 2"x12"x10", 1 meg RAM, backlit VGA, and ext. vid. port, 20
>Meg HDD, 1.44 meg floppy, $1995.
>
>Compaq LTE
>20MHz 386, 7 I/O ports, 30 /60 meg HDD, 3 meg RAM, 1.44 meg floppy
>
>Dataworld NS 320SX
>386sx, VGA with ext. vid., 2 meg RAM, 20 meg drive
>
>Others include the Northgate slimline, and the Austin sx, with standard
>2 meg RAM. These machines have stated weights of under 7 lbs, including
>the battery charger. I doubt the notebook ST wieght includes the
>charger. Without the charger, they weigh in less than 6 lbs. Granted
>they weigh a bit more than the ST notebok, but do NOT tell me that they

A *bit* more?! The Atari notebooks are supposed to weigh about 1 kg. The machines you list weigh more than *twice* as much as the Ataris, even without the charger, and are more than *double* the volume (the Ataris are supposed to be about 1" thick). And it doesn't stop there. These machines have a battery life of 2-3 hours with "average" use, dropping to about 1.5 hours with moderate disk access. So they're practically useless as true portables unless you carry along an extra battery pack or two along with the charger, rounding things out at about *3-4 times* the weight and *triple* the volume of the Ataris. And these machines are state-of-the-art for so-called DOS "notebooks". (BTW, I don't suppose you'd care to tell other net readers how much the Compaq LTE will lighten their wallets.)

>are figments of my imagination, or that there are no machines out there
>with both a hard drive and a floppy, as the guru TRH has stated. There

I told you in email that you and TRH are working with different conceptions of "notebook". Your definition is approximately: "Not much bigger/heavier than the abridged version of the Oxford English Dictionary." His is: "Not much bigger/heavier than a notebook." For TRH's definition, he's right; there are currently no machines that fit the latter description with both a hard drive and standard 1.44 meg floppy, even when you don't include the charger and extra batteries.

>are others that are lighter, and are closer to the ST notebook, but I
>have better things to do than to reread piles of magazines just to
>vindicate my position against the cries of the ignorant. I think I'll

[Translation: "I was wrong; I haven't been able to locate any machines which come anywhere close to Atari's size and weight specs with all of the features that I was asking for."] C'mon Mark, put up or shut up. If you have better things to do than re-read piles of magazines in an effort to vindicate your position, at least you could do us the courtesy of finding something better to do than hanging out your own ignorance for public display.

TRH was right, I'm afraid: You don't know what-in-the-fuck-you're-talking-about. Nothing wrong with that; all of us are ignorant about lots of things, and the net is an ideal forum for learning from others and thus curing our ignorance.

You, however, had the unconscionably bad taste to publicly insult both Atari Corp. and TRH based on your ignorance. (You do recall, don't you, the post in which you suggested that TRH's machines had been deliberately crippled in an effort to sell more STacys? It was the one that prompted his original vituperous reply.) And you continue to do so, in the most obnoxious way possible. The gracious thing to do, I think, would be to apologize. Barring that, I suggest that you desist lest you make a bigger fool of yourself than you already have.

Regards, BBB

>to run it optimally. Also, Sun's decision to have an open architecture is
>resulting in a flood of systems based on the SPARC chip set....

From an article in April Datamation, I see that Sparc International is only half-open: Their "shrink-wrap" API requires Sun-OS. The article was about the 88000. 88Open doesn't require a certain OS to be compliant. As a result, even though only 6 US vendors have picked the 88000, there are over 2000 applications available, while for the Sparc, with some 30 or so vendors using it, there are only about 2500 applications. The article praised the 88000 and 88Open on technical grounds, but mentioned that Motorola's marketing was "methodical at best." It also mentioned that Motorola has cut the 88000 price by 2/3, and that the 88010 will be out "soon". Top-of-the-line 88000 is about as fast for non-floating-point as the fastest Sparc or MIPS, but has better support for multiprocessor architectures (according to Harris, who build a multiprocessor server from it). When 88010 is available it should be substantially faster, even for floating point, than current Sparc or MIPS. That is, almost as fast as the new HP PA chips %). (57 and 76 Mips are the speeds the newest HP machines are guaranteed not to exceed. $k12 and $k20 in greyscale, diskless.)

2888. Atari Auction Update.

Newsgroup: comp.sys.atari.st
Date: 1991-04-10 18:12:05 UTC
From: meo3@jaguar.ucs.uofs.edu
Message-ID: <414@platypus.uofs.edu>
Source record: 233387

First, let me thank everyone for all the responses I'm getting. The auction has barely begun and I've received a number of responses. Along the lines of my previous message(s), I want to reiterate that it was never my intention to post updates daily.

However I am getting so many bids of equal value that I feel in all fairness I should post at least daily for those people who are especially interested in how things are going. BTW, I have not been mentioning the name of the particular bidder. Upon refelction, I feel that it would only be fair to list who's bidding what. If you have an objection, let me know with your bid, and I wont list your name. Finally, before the update let me address those who have asked me specific questions about the software I've got (about 3 side-by-side cases full). I am currently not able to give you a breakdown because my software is at home, with my machine. However, this weekend, I will compile a quick list for you and post it.

And, as of Wednesday afternoon, the highest bid is: $350
(what a steal...)

Next week I'll also post a list containing highest bids on individual items. Most people seem interested in the complete system, which is how I originally planned on selling it. But, I am entertaining all offers. Bid Away! :^)

From: alanh@logitek.co.uk
Message-ID: <alanh.671307307@krypton>
Source record: 233388

Hi,

I am currently using a GE-Soft SCSI Controller hooked up to an
Embedded Segate ST157N - 48 Meg Drive. Using SCSI ID 0, LUN 0.

Does anyone know if it possible to use the same controller and have
two drives connected through a two drive attachment cable. So one drive uses
SCSI ID 0, LUN 0 and SCSI ID 0, LUN 1.

Answers please to either this newsgroup or mail me(Address below).

Alan Hourihane.

The Imagewriter does NOT need to print everything as a bit-image, though it
obviously can, nor does that have anything to do with whether the interface
is serial or Centronics parallel. The Imagewriter II will print ASCII text
quite easily, in either draft or NLQ mode, and optionally in color. No need
for "dots" or "very special" drivers, just a regular driver.

But it does have an ASCII mode, so any text based word processor would be
able to use it. (But unless it has a printer driver for an Imagewriter, it
won't be able to bold, underline, etc.)

But you still would need some printer driver to do any screen-dumps, and
any graphic oriented prg will need a printer driver.

The .reb extender siginifies that were created usisng Prorebel, a copier
which allows you to copy wierd disk configurations.

It was stated vey clearly in the index that prorebel was needed to properly
run this demo.

Prorebel is a coprighted program, thus it is absent from the archive. If
anyone has a more widely known copier that will work similarly, please
let me know.

2895. Atari ST notebooks

Newsgroup: comp.sys.atari.st
Date: 1991-04-11 00:09:28 UTC
From: darling@cellar.UUCP
Message-ID: <Haq8Z1w164w@cellar.UUCP>
Source record: 233207

Nobody should be surprised that when Mark Choi pointed out the highly un-competitive construction of the upcoming ST notebook machine, some brainless sycophants would crawl out from under whatever rocks they inhabit to yell "How DARE you criticize our god". It's particularly offensive, however, to see boneheads like Bob Bright attempt first to invalidate Mr. Choi's well-deserved criticism with some minute discrepancy concerning the machine's weight, and then ask for an apology in the same paragraph that he favours us with another brilliant profanity. Where do these people come from? Does Atari pay them? If so, couldn't they afford to hire more intelligent people?

If TRH is any indication, apparently not.

Bob has failed to respond to my post concerning the Dell laptop, one of which I am in posession of. Why did he ignore this? Quite simply, because it completely invalidates his make-believe picture of the competition in this market.

People like Bob are annoying not only because I have to add them to my /kill file in an effort to upgrade the calibre of incoming news, but because they spread false information and therefore contribute to the demise of a company many of us have genuine concern for.

Give it up, Bob. You're a fool, but you don't have to advertise it.

It's true that the Mac is very "dot oriented" but the ImageWriter and
ImageWriter II do indeed have built in character sets, and can be used to
print ASCII text as well as graphics. I know quite a few people who used
Imagewriters on their Apple II's, for example.

The part about interfacing is true, though. The Imagewriter is a serial
printer, so you would need to switch between printing and modeming.

>

There is a translation table in Flash, but I don't think you could emulate a different terminal type just by adjusting it. This is my only gripe about Flash 1.6, it is not very configurable (as compared to Uniterm). I once heard of a Flash 2.0 coming out (I think in Znet), anyone know about it? Anyway, if you want to go VT220, get Uniterm 2.0e. I believe you just select it via radio button, and away you go.

.reb files originate from ProRebel, which is a hacked (pirate) version(s) of Procopy. It allows you to copy a protected disk into a file, which can be uploaded to a Pirate BBS. A pirate on the other end can download it, and use ProRebel to create a new "protected" disk. This program also allows you to have several versions of Procopy being controled by one front end (GEM). It has nothing to do with ProCo, it is an illegal product. This is most annoying, as this means that the programs do not even have to be "broken" to be Pirate BBS fodder.

2900. using gcc

Newsgroup: comp.sys.atari.st
Date: 1991-04-11 01:07:14 UTC
From: Bill_Moore@mindlink.UUCP
Message-ID: <5458@mindlink.UUCP>
Source record: 233156

I am new to the net and notice a fair amount of discussion about gcc.
I am a recreational c programmer, and use mostly mark williams c. Things I
like about it are the integrated cli, a fairly fast emacs editor, and
relatively small code. It isn't ansi, its not public domain, and there isn't
likely to ever be an mwc c++. It also has a pretty good source level debugger.
It assembly language format is weird tho.
I would be interested in hearing from users of gcc about what they like
and what they don't. If people think this is appropriate for the whole
net, fine; if not e-mail me and I will post a summary.
Thanks!!
...Bill

Yup, and I'm not surprised to find that you, my Darling, also think
you know enough to write briliant, insightful postings about a product
that doesn't exist yet.

How about participating in some useful discussions instead of acting
like a brainless anti-sycophant? Or perhaps we could revive the
Atari/Amiga flamewar for a few months so we could all seek out a rock
or two to hide under.

Followups to misc.test.

2902. Phone Help...

Newsgroup: comp.sys.atari.st
Date: 1991-04-11 05:44:20 UTC
From: d_alvear@jhunix.HCF.JHU.EDU
Message-ID: <7955@jhunix.HCF.JHU.EDU>
Source record: 233212

First off, I realize this is NOT the newsgroup for this question, but I figured the net police would tell me where to send it. Also, I've found that many Atari owners are helpful.

Here goes...

I found this old (circa 1985?) phone in my kitchen. It is a two-line phone with 30 number memory (actually 34), speakerphone, etc. The problem here is that I can't remember for the life of me how to program it! I can't find the instructions. (Of course I didn't look to hard...) Now that I brought it back to school with me (I found it in my parent's kitchen actually...), I was hoping that some great god of phone knowledge could help me.

The phone was made by a company called "unitech". The model number is AFF-20. I could describe the phone, but I figure I'm already wasting bandwidth. So, if anybody knows how to program old phones from unitech or even has this same phone that would be great! Otherwise, a phone number or a point in the right direction would be appreciated.

Sorry for posting in the wrong newsgroup, but I didn't know where to turn.

Dom

2903. Why does GDOS slow down midi output?

Newsgroup: comp.sys.atari.st
Date: 1991-04-11 07:46:49 UTC
From: geert@ahds.UUCP
Message-ID: <1943@ahds.UUCP>
Source record: 233211

I recently installed a program that uses GDOS or
AMCGDOS. When I did this, some of my midi programs are slowing
down there output to my midi instruments.
I think that only midi programs, that are using
atari's midi out TOS call (as i remember it Midiws()), are
slowing down there output.

Is this because there are some additional functions added by
GDOS/ AMCGDOS and the ST must search into a table to lookup
some routines, also the ones in the ROMS?
If this is the clue, why can't GDOS bypass the default routines
,which are normally in ROM, immediately and uses the GDOS
functions afterward? It seems to me that GDOS first looks
if there is a GDOS function called and then passes to the
default ROM functions if a not GDOS call is called.

Is there a GDOS version available, which hasn't this problem?
Any suggestions out there?

Thanks in advance.

Geert.

2910. New version of Turtle - where?

Newsgroup: comp.sys.atari.st
Date: 1991-04-11 11:59:04 UTC
From: grahamt@syma.sussex.ac.uk
Message-ID: <4833@syma.sussex.ac.uk>
Source record: 233128

The version of Turtle which I have - and the version which was at atari.archive when I last looked (on April 10th) - is 3.0. I know that George Woodside has released a newer version to Compuserve & Genie, but he has told me he cannot upload it to ftp sites.

Would some kind soul who has the latest version (sorry - I'm not sure what the version number is) please upload it to atari.archive and/or tell us of ftp-able sites which have it already? A description of new features would be nice, too.

Apologies if my information is already out of date.

Graham

2914. ST and RC stuff

Newsgroup: comp.sys.atari.st
Date: 1991-04-11 14:44:22 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991Apr11.144422.26896@lsuc.on.ca>
Source record: 233227

1991/04/10

Atari ST and RC:

1. My article called "Bolink Rebirth" was published in the March
1991 issue of "Competition Plus". This is a magazine for Radio
Controlled model car racing. The Atari 1040ST with Drafix 1 software
and the Toshiba P321 printer are featured in that article as being
the tools used to develop parts designs.

2. In the May 1991 issue of "Model Airplane News", Bill Griggs
reviews the "R/C Aerochopper" simulator which runs on the Atari
ST with a special dual, full proportional, joystick system.
This simulator is distributed in the US by Futaba.

3. I received my update for Spectum Holobytes' "Falcon" F-16
simulator 2 days ago and I've run it on the 1040ST with TOS 1.4.
It's working fine overall. The software still seems to have
some operational rough spots. I've found that occasionally the
disk "active" light will stay on when it shouldn't, but so far
it's not happened in such a way that I couldn't "force" it off.
This should NOT be necessary. I find this a bit discouraging.
In dealing with a 3rd generation (version 1.2) of a commercial
piece of software on a common and fairly standard system (the
system was an unmodified 1040STF with TOS 1.4, an Atari original
SF314 floppy and SC1224 monitor being the only active attachments),
I don't think I should find fairly obvious functional bugs within
the first minute of use. But aside from that I'm now having fun
learning all about the F-16. According to the update erata sheet
the "R/C Aerochopper" joystick system I mentioned above works
with "Falcon". There's no mention of the STE 15 pin joysticks.
One would hope that they'll have them supported in the future.

2917. Project management software

Newsgroup: comp.sys.atari.st
Date: 1991-04-11 15:34:50 UTC
From: jhm@snitor.UUCP
Message-ID: <jhm.671384090@nixtdc>
Source record: 233399

Can someone recommend any project management software for the ST?
I need something that does gantt (I'm not sure of that spelling) and pert
charts. Any other goodies to bamboozle clients with are a bonus.

(I doubt it matters, but...) I'm using a vanilla 1040ST, meagre 20 meg
disk, 24-pin Raven printer.

Post if you think it's of general interest.

Thanks muchly,
John McMullen

Address: 141.211.164.8

> I read once that there should be such thing like a csh for the ST.
> Could anybody tell me, if that is true and if where to get it?

I like Gulam. This csh-like shell has:
(1) A built in terminal emulator
(2) A built in micro-emacs
(3) A rich set of more than 60 built in commands (alias, set,
which, if, touch, rm, ...)
(4) The ability to execute shell scripts
(5) The ability to find and execute external commands

There is a bug in the built in "cat". But there is a program "fcat".
That, with aliasing and feature (5) gives a workable solution.
The documentation is complete and good.

It is at atari.archive.

> the joystick back and forth at an even pace?" Those traps always get me!

Get the boot oil, don't put it on until you have 2 gems and a rock.
Head to the lower right of the maze, apply the oil.
Enter the hallway with the green slime....
Drop the rock on or near a slime....
PICK UP YOUR NEW GEM!

Next, solve the puzzle and go to level 3.

On level 3, prepare to be shish kabob...
(When you get there, you'll know. Think about this, I got through the room on my
first try! I didn't realize there were traps EVERYWHERE (function of time) until
my second attempt... :-))

Pits, I just avoid them.

> Thanx in advance,

Sure. Ps: The hints in the book really help. Want some codes for perfect level
completions? :-)

2921. Flash & QuickST

Newsgroup: comp.sys.atari.st
Date: 1991-04-11 19:07:16 UTC
From: sslee@polyslo.CalPoly.EDU
Message-ID: <2804b3e4.2556@petunia.CalPoly.EDU>
Source record: 233223

I have Flash v1.52 and QuickST v.2.20 and it seems either no one comes across this problem or everyone is just ignoring it. The problem is that Flash tends to leave remaining cursors everywhere on the screen (I'm emulating vt100). Even when I disable QuickST, it still does this. Only when I not load in QuicskST on autoboot does the problem disappear.

I've tried using some german program (called fixflash or something like that) but it doesn't seem to work. Alas, I have no docs to that program.

I'm not sure which program is at fault, but it sure is annoying. It even warrants me to boot Flash on my disk drive (yech!) as opposed to my hard drive so I don't have to reconfigure my autoboot programs there.

Steven

2922. Buy Atari stocks now

Newsgroup: comp.sys.atari.st
Date: 1991-04-11 19:07:44 UTC

I was talking to a dealer yesterday and he told me (here in Toronto) that now is the time to buy Atari stock. It is at its lowest and should be going up in the near future. Anyone here own Atari stocks? I am interested in buying a few shares (I don't have much cash) and want to know the prices roughly? Also, considering I live in Toronto Canada, how would I go about doing this?

S.S.

2923. Atari in Movies (Hey, this ain't aabout the noetbook!)

Newsgroup: comp.sys.atari.st
Date: 1991-04-11 19:36:55 UTC
From: mc4c+@andrew.cmu.edu
Message-ID: <Mc1=fLe00WBM02NxJ=@andrew.cmu.edu>
Source record: 233233

I was watching the movie "Nothing but Trouble" (which, incidently, was GREAT) the other day, when right near the beginning, what do these Atari bashin' eyes of mine spy, but a STacy! Right there on a desk with office work piled all around while Demi Moore screems on the phone. Now, I happen to hate product placement, but as everyone seems to be doing it, and Atari has done next to nothing in advertising in the past, this is a welcome change. It is good to see the STacy during every Arsenio Hall show, as well. (Too bad Atari can't get them to turn the damned thing on!) Hopefully soon they will start to take on some really big campaigns. We will have to wait and see. Or maybe Atari had nothing to do with it, and a studio musician just happened to have one around when they needed props... .

-geisha-

P.S. You didn't think the post would be ALL positive, did you?

2924. Auction Update

I've had the same problem with earlier versions of QuickST and other
programs (I'm not a Flash user). For awhile there, we were getting a new
version of QuickST over the net every couple of weeks. I'd uudecode it,
unarc it, install it, discover that it was still broken, and erase it.
I'm sorry to hear that it still doesn't work right.

If QuickST is indeed fixed and this turns out to be a Flash problem, I hope
somebody will let me know. Otherwise I'll buy Turbo ST one of these days
when I'm in the mood to write a check.

Maybe because it's not a bug.

>The XBIOS 5 call setscreen(logadr,physadr,resolution)
>is used to set screen adresses and change screen resolution.

>The routine does NOT wait for vertical blank as it i supposed to
>but resets the video in the middle of the screen, causing the
>picture to wrap around the left edge of the screen in 50% of
>the cases. This does not look good (you get the edge of the
>grapic screen in the middle of the monitor screen :-)

Thank you for starting a panic. I think it is not a bug but a problem with your Mega STe. I can not reproduce the "bug" you report. It might have occurred to you that your Mega STe is to blame, not TOS.

Your lack of understanding of the reasons for the protection code in the ROM has led you to a false conclusion. To nip this in the bud, I'll explain. The shifter mode must not be changed during a critical moment around vertical blanking. Previously that was avoided by waiting for the vblank interrupt, which ensures that the critical moment has passed. The new code uses another method: it checks to be sure that you are in the middle of the screen someplace, not in vblank. The upshot is the same: you avoid the window of vulnerability.

If you had named the programs that caused trouble this would have been a more useful bug report. It is possible that there is an interaction between those programs and the new code. Please post or mail me the names of those programs.

If this turns out to be a real live software bug, I will eat my words.

(Lars-Erik has responded to me in mail about the programs (e.g. Degas Elite) and I have suggested that he return the machine to his dealer. This posting is for everybody else, so you don't think we're totally out to lunch when it comes to testing software.)

2933. Atari 8-bit SW for sale (long)

Newsgroup: comp.sys.atari.st
Date: 1991-04-12 01:54:27 UTC
From: clf3678@isc.rit.edu
Message-ID: <1991Apr12.015427.23386@isc.rit.edu>
Source record: 233210
Cross-posted to: comp.sys.atari.st,misc.forsale,misc.forsale.computers

UPDATED 3 APR 1991

List is formatted to be PRINTED, not
viewed!

You've seen this list before, but not these prices! All prices have been
reduced by 50%! I want to sell ALL of this software NOW!

Any purchases over $50 receive a 10% discount (software
only). PLEASE contact me BEFORE sending any money to make
sure your item(s) get reserved!

I can be contacted via:

GEnie: C.FREEMESSER
Usenet: clf3678@isc.rit.edu
Bitnet: CLF3678@RITVAX
Phone: 716-328-1703
BBS: 716-436-3078 (I'm the Sysop; 2400 baud max)

Mailing Address:

Chris Freemesser
223 Renouf Drive
Rochester, NY 14624

Disclaimer: ALL ITEMS LISTED BELOW ARE SOLD AS-IS, with no warrantees
---------- expressed or implied. Not responsible for any typo
mistakes made in this list. All software is in good
condition (i.e. I threw out any physically damaged disks I
found). ALL (and I mean ALL) items are ORIGINALS, no
pirated stuff here!

Terms: Orders must be pre-paid, either by check or money order.
----- Please do not ask for a COD order. When ordering, please
refer to an item by its number. Since there may be more
than one copy of a title, the # will keep confusion at a
minimum.

Shipping: Shipping will be by EITHER parcel post (for small items),
-------- or UPS ground for larger orders. Please include $2.00
shipping for first item, .50 for each additional
title. Prices are for shipping within the continental US.
Prices appropriately higher for other destinations.

Definition of Terms:

Num = Item number (always refer to item by its number)
Pkg = Whether or not item has its original packaging. Software that
did not have its original packaging has been placed in a resealable
bag to protect the media.
Doc = Whether or not item has its documentation

BRAND NEW SOFTWARE

I obtained a case of the following software. You can purchase
these packages separately, or buy all three for $7. This is NEW
software, still factory sealed.

502-511 Action Biker (C64/Atari ver.) $2.50
514-518 Kikstart (C64/Atari ver.) $2.50
521-529 Speed King (C64/Atari ver.) $2.50

MISC. SOFTWARE

All software is DISK ONLY, no instructions or original packaging.
Some software may have instructions on the disk itself. Make an offer
on large purchases!

Antic Disks - $.50 each

2934. SIMPLE terminal emulator

Newsgroup: comp.sys.atari.st
Date: 1991-04-12 02:35:20 UTC
From: warwick@cs.uq.oz.au
Message-ID: <747@uqcspe.cs.uq.oz.au>
Source record: 233236

Is there a SIMPLE terminal emulator at atari.archive? I use Uniterm for most things, but I'd like a REALLY simple emulator for quickly switching back and forth from the command line (Mupfel) to the terminal emulator. I don't want any screen clears and stuff like that, just plain AUX:<->CON: type commumnication. Mupfel has a variable sized Console Window, but I can hack TERMCAP at the Uni end to correct for that.

Alternatively, is there source to a fairly simple emulator that I can strip down somewhat?

Thanks for any info!
Warwick

Message-ID: <114586@unix.cis.pitt.edu>
Source record: 233234

Is there a program available anywhere that will take WordWriter
output and convert it to PostScript, suitable for LaserWriters?
Or, alternatively, is there a program that will take WordWriter
output and convert it to either IBM WordPerfect or WordStar?
(I have a publisher who'd be grateful if I could send the
stuff in her own format)

Sea Wasp

2936. CAD 3D create and read in C?

Newsgroup: comp.sys.atari.st
Date: 1991-04-12 04:22:14 UTC

2938. The language named C

Newsgroup: comp.sys.atari.st
Date: 1991-04-12 05:47:54 UTC
From: kllove@uokmax.ecn.uoknor.edu
Message-ID: <1991Apr12.054754.7583@uokmax.ecn.uoknor.edu>
Source record: 233246

This summer I'm going to be teaching myself how to program in C. My biggest (and brightest?) question is: "Which version of C is the best?".

I realize that many factors could influence my (or someone else's) opinion. So, I'm going to list a few.

The code must be somewhat portable between systems (i.e. Is there a standard and how far do the ST versions diverge from it?)

The company support must be existant. {I think that is self-explanatory.}

Are there good books available for the learning of this version of C? (Or would any book on C be sufficient?)

Would it be better if I knew something about the internals of the ST? (Is C like Pascal in that knowing the system hardware is uneccesary?)

If I am fluent in Pascal, how difficult is C to learn? (Are they different conceptually? i.e. pointers = what in C? Does C have some things that Pascal doesn't? etc.)

Is Turbo C going to be released in English? (I have NO desire to learn German, especially if all I was going to do with it was work with Turbo.)

What kind of editor do the various versions use? (I like 'vi' over 'ed' anyday! :) (Is the mouse supported?)

Does C use anything like a CLI or is it GEM only? (I use 'csh' on the Unix system here at Okla. U. Does C use a shell like 'csh'?)

Can I use any of the versions of C without a hard drive? (I don't have one and it may be next fall before I do get one.)

How much does the language(s) and book(s) cost?

That's all I can think of. (I think I hear cries of, "Isn't that enough?"... Nahhh... Couldn't be! :)

adTHANKSvance,
Kenneth Love

2939. Re: Graphics on the STE - v. generally speaking...

Newsgroup: comp.sys.atari.st

From: logajan@ns.network.com
Message-ID: <1991Apr12.061012.9974@ns.network.com>
Source record: 233242

In article <1039@stewart.UUCP> jerry@stewart.UUCP (Jerry Shekhel) writes:
>VGA simply has 6 bits per primary color, for
>a total of (2^6)^3 = 262,144 colors, with 256 palette entries. No tricks,
>no horizontal-sync interrupts, none of that crazy stuff. On a monochrome
>monitor, you get 64 levels of gray.

Perhaps there is more than one way to VGA. I do know that there are
palette chips for sale that include a 256 entry table and three built
in DAC's (digital to analog converters). I forget if they had 5 or 6 bits
per color though. 5 per would fit in two bytes while 6 per would need three
bytes.

Oh, and the palette chips claim to be VGA compatible.

2940. Shareware and programming

Newsgroup: comp.sys.atari.st
Date: 1991-04-12 06:14:21 UTC
From: kllove@uokmax.ecn.uoknor.edu
Message-ID: <1991Apr12.061421.5987@uokmax.ecn.uoknor.edu>
Source record: 233248

I want to program a game or two this summer (see previous message for the language).

Does anybody have any knowledge on the concept of shareware? Does saying it is so in a doc file constitute it being shareware?

I would rather have the possibility of getting money for the time I spend programming, but it wouldn't be essential. That is what I consider to happen when someone releases a program as shareware. Is this what does occur? How often does someone get something and how good/useful does the program have to be before one would expect to receive anything back?

That probably didn't make much sense (it doesn't to me and I just wrote it!), but I hope somebody understands it enough to reply.

In case anybody is interested, one of the games I'm going to write is a solitaire game that I haven't seen anywhere (it's a LOT tougher than Klondike ever was). If you've ever played Spider then you have a good idea of the rules, except only one deck is used and only kings are allowed in "spaces". If anybody wants the rules (as taught to me), just send me some mail. (It really is one of the better solitaires, if you don't cheat a lot. When you do beat it, though... Well, you get the idea. It's also, IMHO, one of the most frustrating. I have had situations where 3 of the 4 suits had been removed from the board and was left with all the rest the cards in order [queen to ace], except the king was the last face-down card and the queen was sitting on top it. Since only kings can be moved to blank spots, I lost!)

I haven't decided (yet) on the other game (it might not be a game for that matter). Anybody got any suggestions? (Please consider that this will be only my second program on the ST and in a language I will have only started to learn this summer. I consider myself fluent in Pascal, but ignorant in C.)

Kenneth Love

I forgot to mention that I would prefer to receive e-mail on this.

I thought of another question: Does anybody have any well documented C source code for playing with graphics and sound on the ST? Would this probably be helpful in learning what the ST's ranges are? Should I get some other book(s) about the ST's capabilities?

Thanx again,
Kenneth Love

2944. Help me! My SM124 (ST monochrome monitor) died like so many lately

Newsgroup: comp.sys.atari.st
Date: 1991-04-12 06:59:25 UTC
From: mspacek@fquest.fidonet.org
Message-ID: <qX40Z1w164w@fquest.fidonet.org>
Source record: 233008

Well, I've seen a thread of messages about monochrome monitor problems lately, but pretty much ignored it. After all, it could never happen to me! Right, well it did happen to me. The other night it had been on for a while... I was online with a BBS and all of a sudden I thought the characters were starting to look funny, like they were slanting just a bit and getting thinner. Well, just a moment or two later the screen went dark and the green power light were dark also. When I turned the system off I could still hear a humming from the monitor, the power supply I suppose. I then cut it off to be safe. I opened it up and checked the fuse. It was blown. I really didn't expect it to be that simple, but thought it was worth a shot. I went to Radio Shack and bought a couple new fuses of the same rating. I thought I might have gotten lucky because it seemed to work fine after I replaced the fuse and put it back together. But after a little more than 30 minutes elapsed, it happened again. This time I was looking at the right side of the screen when it occured and the letter were definitely getting VERY thin right before it happened. Once again, it was only a moment or two after I noticed the character distortion until it went out. Anyway, I'm hoping to get some help in diagnosing the problem since there isn't much in the way of local dealer support. Oh, I thought both times that the monitor felt hotter than it should have right after the fuse blew. I would also welcome advice on what I could do if I can't fix it. Like good places to send stuff like that to be repaired (if there is such a place, not around here anyway), or what Atari Corp's exchange program pricing is currently. If anyway has had a posted for help with a similar sounding problem, I would sure love to hear what happened to them and possibly a recap of the help they got. I guess mail it would be best to mail anything to me, unless you think others would find the info interesting or helpful. I know I should have been reading the posts that have been on here lately and may well have already known the problem if I had, but well, I didn't. So, any help will be greatly appreciated. I really like my mono monitor and miss it greatly. I'm quite used to it and want it back pretty bad. SOMEBODY HEP ME PLEASE!!! Heh...
Thanks in advance from a SM124 addict suffering from withdrawal symptoms.

Look in the directory atari/mint and you will find 2 programs that
should suit your needs, st52 by me and tip by Howard Chu. If you need
any features at all, use Howard's program, as mine takes the
expression 'dumb terminal' very literally.

2946. PgC 7600 details

Newsgroup: comp.sys.atari.st
Date: 1991-04-12 08:47:40 UTC
From: kiki@uhunix1.uhcc.Hawaii.Edu
Message-ID: <12430@uhccux.uhcc.Hawaii.Edu>
Source record: 233003

The following information is from the international edition of BYTE magazine's March '91 issue. Back issues are available by calling BYTE at (603) 924-9281.

The international edition adds about 150 pages to the U.S. version of BYTE and contains many ads and product announcements of firms participating at the CeBIT Hannover Fair. Two articles by Dick Pountain, Byte's contributing editor in London, concern the PgC 7600 RISC and the Taos multiprocessing OS. The PgC 7600 is touted as a second-generation RISC processor capable of 160 MIPS, Intel 80x86 emulation and embedded control. The chip will reportedly sell, in quantity, for $20.

The Taos OS may also be of interest to this newsgroup, not only because of its ability to run identical code on different processers, but also because it influenced design changes in the PgC 7600 processor. One of the architects of the Taos OS, Chris Hinley, is also experienced in writing games for the Atari ST and Amiga (Verminator and Onslaught). His technique of using object-oriented assembly language with a large number of macro libraries in game design was used in the construction of Taos. A fellow programmer, Nick Spicer, is using his knowledge of transputers to implement parallel processing capabilities. For further information, refer to the article starting on page 90IS-117 of the international edition of the March '91 BYTE.

The following article on the Pgc 7600 is actually about three pages long.

------------------------[excerpt of PgC 7600 article]-------------------------

[The PgC 7600 RISC processor is the result of a collaboration between Chris Shelton and Sir Clive Sinclair, two computer designers. Shelton is known in the U.K. as the designer of the Nascom and SigNet computers. The Nascom was a single-board computer, while the SigNet allowed multiple users to connect with a network of close-coupled Z80 processors. Sinclair is known worldwide for his inexpensive, yet capable microcomputers, as well as many other inventions. Sinclair and Shelton's goal is to produce an ultra-low cost workstation by basing it on a chip that integrated computational, memory and video RAM control, networking, and timer logic.]

The processor, code-named PgC7600, has been in development since 1988 by a small team led by Shelton and financed mainly by Sinclair. Computer simulations of the chip were completed by July 1989 and masks for making it by March '90. First samples failed because of a process fault, and second samples revealed a flaw in the RAM interface. I had timed this article to coincide with the delivery of third (working) samples of the chip, but these have been delayed. Hopefully, a PgC7600 will be running by the time this article is published.

The key idea behind its design is that speeding up a RISC processor eventually takes you to a point at which you cannot keep up with getting signals on and off the chip. Shelton therefore decided to isolate the RISC CPU by completely surrounding it with on-chip peripheral-control units that handle all the communications with the outside world (e.g., memory accesses, interrupts and I/O channels). The PgC contains on-chip timers video RAM support, interrupt vector generation, DMA, an I2C bus for LANS, and a memory controller (MCU) which can refresh dynamic memories.

All the PgC's interfaces to the outside world have been optimized for speed. For example, the chip uses unbuffered static-column mode for RAM accesses and a small but ingenious on-chip cache (called the Q-cache) to keep the processor fed with instructions. In addition, to further improve the memory bandwidth for instruction fetches, the PgC has a simple RISC core processor with about 100 instructions, almost all of which are 1 byte long.

To achieve the performance (in excess of 160 MIPS) that he believes is required to emulate other commercial CPUs in software, Shelton is implementing the PgC 7600 in a bipolar process. Because of its high power consumption, however, bipolar technology has been completely supplanted by MOS technologies.

It does have its advantages: it is faster than MOS and scales down better to submicron sizes. Also, because it is current-switching rather than voltage-switching, it can drive low-impedance loads like CPU pins faster than MOS can, bringing benefits in better CPU-memory bandwidth. PgC skirts the power consumption problem by reducing a logic transition to 0.25 volt instead of the standard TTL 5 volt, which reduces the energy dissipation by a factor of 400.

The process that PgC uses is one originally developed by Ferranti (now Plessey-GEC), called the Collector Depletor Isolation (CDI). It offers access times of 2.5 ns at the modest 1.2 micron scale. The PgC7600 will be implemented initially as a gate array that occupies a 10 by 10 mm silicon chip, but this could be reduced to 7 by 7 mm with a custom layout. Some 33% of the chip area is RAM and ROM. In CMOS, Shelton believes that the 6000 gate chip could be implemented on a 2 by 2 mm die, but performance would fall to 60 or 70 MIPS.

The bipolar process requires fewer masks than does CMOS, so PgC hopes this will help them produce the chip for $20 in quantity. This, in conjunction with the fact that it requires few glue-logic chips, could make it attractive as an embedded controller as well as an almost glue-less CPU for low-cost workstations.

The prototype PgC7600 has an integer CPU that is expected to operate at about 160 MIPS. There is no on-chip FPU. The CPU is provided with 40 registers, divided into five banks of eight. All are 32 bits wide and can be accessed in 2.5 ns, giving a processor cycle time of about 5 ns.

The register architecture is designed to be scalable in future versions while maintaining compatibility with earlier versions. To achieve this, the register banks are named 0, 1, 2, 3, and TOP. When an interrupt is serviced, state information such as the accumulator and pc contents are saved only in the TOP register bank. Designers could add more banks (numbered as 0, 1, 2, 3, 4, 5 and TOP) without causing programs written for earlier versions to break.

The Q-cache is a fast (2.5 ns) on-chip RAM that is 32 bytes long and can, therefore, hold an average of 32 instructions. In hardware terms, the Q-cache is implemented as a circular buffer. During sequential program execution, it gets reloaded in single-word (32-bit) chunks, thereby acting as a 32-byte moving window into main memory. When a branch instruction causes the cache to become invalid, it gets reloaded in 64-bit chunks, and each chunk can start executing while the next one is loading. Like the register architecture, the Q-cache is transparently scalable for future chip versions.

The MCU is described in PgC's documentation as aggressive, and this is no exaggeration. It controls most of the PgC7600's 84 external pins, and it features separate address and data buses. The MCU uses every possible technique to optimize access to ordinary DRAM, and it supports the static-column and fast-page modes of modern DRAM chips as well as SRAM. These modes (also supported by the Acorn ARM and Intel i860) typically allow 512 consecutive data words to be accessed from the same row of a RAM chip. For inexpensive 100 ns access-time DRAM chips, the row-address select cycle time may be as much as 180 ns, but the column-access select cycle is only 55 ns, becoming the effective cycle time. The PgC generates its CAS/RAS multiplexer signals on-chip, so they add only 3 ns to the cycle time. The use of a bipolar drive for the pins allows the MCU to access memory without buffering, saving even more time.

The MCU is the only part of the PgC7600 that depends on external timing. With a 16 Mhz clock, it should achieve a 25 ns cycle time with 15 ns SRAM and a 50 ns cycle time with 80 ns DRAM, providing a bandwidth between 160 and 80 megabytes per second.

Although the original requirements for the PgC7600 to act as a full graphics processor was abandoned, the final design can still act as an integrated CRT controller. A dedicated interrupt causes a jump into a ROM subroutine, which grabs a video address from the TOP register bank, puts it into the MCU, and then requests a VRAM access cycle. Control then returns to external code, which computes the next video address. If you put your video-synchronous signal onto this interrupt pin, the PgC7600 becomes a CRT controller for video buffers implemented with VRAM chips. Shelton estimates that controlling a 1024 by 768 pixel by 8-bit video buffer in this way would consume about 1 percent of CPU time.

The original purpose of the high performance promised by the PgC7600 was for full-speed emulation of other processors, especially the Intel 8086 family, in software, allowing the chip to drive a low-cost IBM PC-compatible workstation. However, PgC is now envisaging broader applications. Though the chip does not have special communication hardware like that of the Inmos transputer, its fast memory access would enable it to be used in parallel-processing systems where shared memory is the communication channel between processors.

This sort of system would be ideal for running distributed message-passing operating systems such as Helios or Taos (see my article: "Taos: An Innovation in Operating Systems"). PgC has been in close contact with the developers of both operating systems and has even modified the instruction set of the PgC to better accommodate the Taos's message-passing scheme.

As mentioned, the Pgc7600 has no hardware for floating-point arithmetic, which would seem to disqualify it from supercomputer applications. However, Shelton argues with some conviction that the superior processor-to-memory bandwidth can be exploited here. The Pgc7600 could feed floating-point data into pseudo-registers held in dual-ported RAM. From there, the data would be autonomously transferred into a streamed FPU, such as those from AMD, Weitek, or Cyrix, and the answers would be transferred back by the same means. Using 15 ns SRAM pseudo-registers, the PgC7600 should be capable of transferring data at 160 MBps (1280 Mbps). If each floating-point operation involved 100 bits, a three-operand scheme could sustain the quoted peak rate of the FPU, which could be up to 33 million single-precision floating-point operations per second. Combining this with the parallel scheme would allow pipelines of many PgC7600s to be constructed to deliver supercomputer performance.

Another intriguing possibility, given Sinclair's Anamartic connections, would be wafer-scale integration, for which the 6000 gate PgC design is an ideal candidate. We'll see what happens.

----------[end of excerpt]----------

For $20, this thing sounds potent, especially in combination with the Taos OS. The article alludes to the other ventures of Sir Clive Sinclair and I recall that he was supposed to be developing a silicon "hard drive", so that it is very possible that our conceptions of power and price may be radically altered.

Though I don't question Sinclair's and Shelton's genius, I have some doubts about Sir Clive's business acumen. The Timex, Quantum QL, Cambridge Computer, and Psion are all pretty good machines, but they had some quirks and were not supported by further development.

I think Atari might be in a better position to deliver and support a marketable product based on the PgC chips, because of their experience with the Inmos transputer and Helios OS, which culminated in the ATW computer.

For the complete article, contact BYTE Back Issues, One Phoenix Mill Lane, Peterborough, NH 03458, (602) 924-9281. In Europe, send requests to BYTE Back Issues, c/o Dynamic Graphics International, P.O. Box 25, 3950 AA Maarn, The Netherlands.

Using ZModem is highly recommended. My version of rz only accesses the disk
at the end of the file, meaning that it receives the file into memory and
then saves it after EOT.
I have never tried the internal X/YModem. The external ZModem is much better,
also because it starts automatically.

There are many shells working in the way the csh does. One of then is Gulam.
I dont know about an implementation of the original csh to the Atari, but
one of the other shells should do.

I have been trying (without any luck) to get the remaining articles of a series that teaches people how to program in GEM. This series is called Professional GEM Programming and was by Tim Orien. If somebody out there can mail me ANY of the articles from 14 to 17 I'd be VERY grateful. Once I get the full series I'll release it (one by one) onto the net.

The Sorcerer is 'Only visiting this planet' but can be found at:

Hi all netters, Germans especially!

First: All you from Germany, have anyone of you had any contact to
Fearn & Music lately, or have you heard anything about them?

I have been waiting 2 weeks to get a reply to my fax, and I have
already re-sent it too...

I am trying to make an order for Uni-Man and T-Script, if someone
knows any other source for them, please tell!

Second: Has anyone of you tried to make a contact to OMEGA Computer Systeme,
the maker of Delta Modul?
Any success? (other than a mailed brochure of Delta Modul)

Third: Afriend of mine wants to use Nec P20 with Spectre, so a Mac-driver
for it would be highly appreciated.
About this you can email also to hv@uwasa.fi

Fourth: If you have any experiences of using the combination Spectre &
UltraScript, for example in a form of short instructions, I would
highly appreciate that too!
Either there is a unknown command & flushing...
or it processes the file right thru, but nothing comes out from
the SLM 804. Test-files come out well, except the scrambled bottom
line...

From: sagemma@eos.ncsu.edu
Message-ID: <1991Apr12.134803.370@ncsu.edu>
Source record: 233009

I just got Oxygen from atari.archive, but when I try to
run it, it doesn't work. I have a 520STfm upgraded to
1 Meg. I can't run the program out of an auto folder
since only drive B is double-sided. When I execute the
program it tells me it's reading in 650k worth of data
and then instantly says that I need a 1 Meg ST. Then it
brings me to a title screen and sits there. I've double-
checked my memory and it says that all 1024k are available.
Any suggestions?
Thanks.

-Steve

I've had this problem with the Unix lharc.

>
>Could somone diagnose the problem?

The problem was that, if am trying to un-lharc a file 'foo.lzh', but I
have another file called 'foo' also, 'lharc' will not find 'foo.lzh'
unless I specify it as exactly 'foo.lzh'. If I just say

lharc x foo

it will report a bad lharc file (once again, in the Unix version).
This bit me because I have a habit of calling my uuencoded files 'foo'
and when 'foo' is uudecoded, the scenario above appears.

> still corrupt in places, (odd lines missing etc)

Hmm, I've tried BGIF but only in 16 Colours Mode, because my Machine has an 16Mhz Acceleration Board which won't work together with Spectre Pics. The results weren't too good, now I got VIEWGF12 from terminator and this one is quite good in 16 Colours Mode, so I presume the SPU Pics it converts to won't be to bad either. BTW: ViewGif supports quite a few Pic Formats including next to GIF and Degas also IFF and MacPaint and some more.

I'd like to build a text-edit routine similar to the one in the Mac OS that is essentially stand-alone and ready to use in any application that I or anyone else, happens to be writing.

I guess this means that the editor should support selecting text with the mouse, standard cut/copy and paste functions and ideally, GDOS capability (so that VDI routines should be used)

Before I started to re-invent the wheel, I thought I should ask here in case people have got advice or pieces of code that might be useful. (I plan to write this in Laser C)

Jon

Thanks for the offer, Jon, but please do NOT. This has been discussed at length in the past. Let's not get into a lengthy discussion of it again -- it's just inappropriate for comp.sys.atari.st.

There is a mailing list for distributing the ZNET magazine to people who want it. I think details are posted in the monthly Frequently Asked Questions file. I assume you have read it.

I'm not against the magazine -- I happen to be on the zmagazine mailing list myself -- but please, not in a Usenet newsgroup.

2220 Grunewald 3003 Dabney
Pasadena, TX 77502 Pasadena, TX 77502
1976 to 1982 1982 to 1985
(713)-944-6999 (713)-944-0734

HIGH: Sam Rayburn High School
2121 Cherrybrook
Pasadena, TX 77502
1985 to 1989
Graduated: June 7, 1989 with a High School Diploma.

COLLEGE: San Jacinto College - Central Campus
8060 Spencer Hwy.
Pasadena, TX 77505
September 1989 to December 1989
(713)-476-1838

SCHOOL NOTES: Although I did not do to well in college, in the spring/summer of 1989, I had all kinds of tests done through the Texas Rehabilitation Commission (TRC). These tests showed that I was more vocational inclined than academically inclined.

Goodwill Industries Supervisor: Linda Mark
P.O. Box 21185 Phone: (713)-692-6221
5200 Jensen Drive May 9, 1990 to whenever hired.
Houston, TX 77026

The training out here at the Goodwill, is vocational training. So, it is more like on-the-job training than anything, because I am being paid a small amount while working, but yet I am also getting trained at the same

time. My goals for Goodwill are
To develop job search, interviewing, and
retention skills.
To assist in vocational exploration
To develop appropriate socialization skills
To build confidence and maturity
To attend work daily and to be punctual
To learn to follow directions and rules
To learn a job skills
I started out making $0.45 per hour, now I am making
$3.80 per hour. Because of the nature that Goodwill
is, the maximum trainees can make is $3.80 per hour.
My training will terminate at Goodwill when I am
hired on with another company. The job skills I
have learned while at Goodwill are office/clerical
work and skills.

Mitchelo's Pizza, Pasta, and More
1900-A Strawberry
Pasadena, TX 77502
(713)-473-8200
SuperVisor: Mitch
May 3, 1987 to May 23, 1987

I was a kitchen helper and a bus boy. The
goals were for me to help around the kitchen
and clean and clear off the tables after people
were done eating. I had to quit so soon though,
because there simply were not enough customers to
keep me on. I was not the only person who was
laid off at the time.

SPECIAL SKILLS:

I have been working with computers now for about 13 years.
Everything I know about computers, I have basically taught
myself. However, in High School, I was in a couple of
computer classes, and in college I took a computer class.
Although I have not been in working environments with
computers, the information I have learned, I have learned
on my spare time at home. I know how to use just about
any computer system out there, and just about ALL software
If I don't know how to do something with the computer, I
can easily learn it, and generally quite quickly.

DISABILITIES:

I have a slight vision problem. I do not have that
much problems with my vision, unless I am in a very
dim lighted area, and occassionally some small
print is hard for me to read. Whatever I have
been told to do, I WILL accomplish, although some

things I might be slower at doing than others. I have problems with my asthma, and need an inhaler or my breathing machine some. Most of the time at home I use the breathing machine, but at work, I can bring an inhaler when I need it. I also have problems with allergies. Due to my allergies, my nose is stopped up 90% of the time, resulting in me breathing through my mouth most of the time. In return, it dries out my mouth and requires me to need something to drink more than normal. I will make do though, on what my working environment consists of though. The one thing I absolutely CANNOT have is anything with PEANUTS. PEANUTS or anything with PEANUTS make me severely sick.

EMERGENCY:

In case of an emergency, you can notify Mr. or Mrs. B.G. Keen at the same phone number as is listed for me, or my Dad, Mr. B.G. Keen at work (713)-644-1206.

2962. GDOS/TT/TTM195 !!help!!

Newsgroup: comp.sys.atari.st
Date: 1991-04-12 23:09:13 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <23454@know.pws.bull.com>
Source record: 233007

Up to today, I have been using an Atari TT with a PTC1426 colour monitor. Today, I switched to a TTM195 monochrome monitor and since I made the switch I have been unable to use GDOS. I was using an assign.sys per Ron Grant's instructions (with the PTC) and had no problems. So far, I have been unable to write an assign.sys file that will not bomb my TT now that I have the TTM monitor. Question, has anyone been able to use GDOS 1.1 with a TT/TTM195 combination? If so, just what the heck is needed in the assign.sys file? Can the assign.sys file be mailed to me or posted on the net PLEASE.

Sounds good, but does this mean that standard RAM chips will be
incompatible with the bipolar version of the PgC? I hope this is not
true of the other version, at least.

>----------------------------[end of excerpt]-----------------------------------
>
>For $20, this thing sounds potent, especially in combination with the Taos OS.

Pretty amazing stuff. This thing uses tricks to get seemingly impossible
cycle times from normal RAM chips. The possibility that an inexpensive
system could be built from this fast part is then far more likely. Seeing
the details also lends the product a bit more credence.

>I think Atari might be in a better position to deliver and support a marketable
>product based on the PgC chips, because of their experience with the Inmos
>transputer and Helios OS, which culminated in the ATW computer.

I'm confident of Atari's ability to create excellent hardware, and
even software, but seeking them out for the strength of their marketing
of the ATW sounds funny somewhere :-). As far as predicting what they
will do, sometimes it's easier to disbelieve their representatives about
this than to believe them. For example, if Leonard says that Atari will
never use the '040, what would this imply to you:
1) that they will use SPARC, MIPS or PgC, etc. in their next machine
and port TOS/GEM to it.
2) they are simply going to discontinue the ST/TT line.
3) they are going to use the 040 anyway but don't want to tell you now
so you won't put off buying a TT.

Thanks for posting an interesting article that a lot of us would
not ordinarily have access to. We may never see an Atari product out
of this, but at least you have helped to establish the PgC as a credible

option ($20 for 160MIPS still sounds a bit off the far end, though).

[more description deleted]

One thing that may cause your problem is that if GDOS runs and there's no
entry for the resolution it's running in in your assign.sys file, it bombs.
There should be entries for devices 5-9 as well as 1-4. You can copy the
font and driver setup from your entry for device 4 to devices 5-9.

5p screen.sys
list of fonts
6p screen.sys
list of fonts
7p screen.sys
list of fonts

etc.

Hope this helps! My G-Print application's installer doesn't do this so
I found out about it recently (as you can imagine).

Since you have GDOS, you might want to try out the G-Print demo. It's on
atari.archive under gprnt_dmo.arc. I'll post a message about it soon (there's
a new version).

Source record: 233020

Hi,
I'm selling genuine Atari Trak-balls for the Atari ST and the Amiga.
They are the CX80 model and are superior to the original 2600 model that
preceded it. The cost for the trackballs are as follows:

$25 for standard trak-ball
$35 for standard trak-ball with right button and 6 foot long
cord

These trackballs work exactly as the mouse. They are also subject to
availability. Postage and handling are extra, I haven't figured out what
it is yet, I'll let you all know.

Send me mail is you are interested.

2970. TT hard disk chaining

Newsgroup: comp.sys.atari.st
Date: 1991-04-13 17:03:04 UTC
From: boyd@nu.cs.fsu.edu
Message-ID: <1991Apr13.124305.11030@mailer.cc.fsu.edu>
Source record: 233024
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a buddy who just got a TT. He wishes to connect his 80mb Supra to the machine (which already has a HD), thus having access to both drives. He did this by plugging the Supra into the DMA socket on the back of the machine. The internal hard disk uses the Atari HD software, and is at SCSI 0 (thus is the boot drive). His Supra is set at SCSI 1.

Problem: The machine sees the Supra, it parks it when park.prg is run, and it can reformat it, but the desktop cannot see the partitions. He tries to install icons for the partitions, and cannot do so.

Does anyone know of something obvious he could be doing wrong (dealing specifically with the TT and the Atari Software)? I have never worked with the Atari HD software, are there any quirks he/I should know about?

Thanks in advance.

>
>Yeah, right. This is what I call quality software. Can't wait to run THIS
>program in my AUTO folder! Does anybody else consider this offhand caveat
>funny?

Dear Mr. Pratt,

If you don't want to use it don't. Some of us don't have both a color
and a monochrome monitor, but have fun checking out neat little software
packages that run on the other moni (EMULA goes both ways). Therefore, when
I used EMULA and it actually worked with most applications (other moni emus
don't work with much) I was quite impressed and though perhaps someone else
might benefit from using it. In making the note about floppy disks I was only
trying to save someone from what MIGHT happen, I never said for sure that it
would. In fact if you use Superboot it would probably be just fine because
you could shut it off on the next boot if it didn't work the first time.

Hi John,
The only project management software for the Atari ST's that
I know of (granted there could be more!) is a program called Critical Path.
Although the name of the publisher escapes me right at the moment; you should
able to get through either a local Atari dealer or mail order. Bye.......

Cross-posted to: rec.games.video,comp.sys.atari.st

PORTABLE ADDICTION Issue #00 April 15 by Tjerk Heymens Visser and Yiri Kohl
The newsletter for the Atari Lynx and the Atari Portfolio

Welcome to this very first issue of Portable Addiction. This issue is just a test issue, so if you find this newsletter interesting, please send us a message.
This is a monthly newsletter for both Portfolio and Lynx users. We will try to cover all the new software that is beeing released for both machines, but we are also planning to do tips, previews, news and a letter page. to test all newly released software for the Lynx, we have made a nice little deal with the local Fun Tronics store. They are now officially supporting us. On the Portfolio front we have a PC expert. He calls most BBS' every day, so if new Portfolio software is released, you'll be the first one to know.

Y.T.Kohl
Editorial assistant

ALL THE LATEST NEWS...(AND GOSSIP)

The NEC TurboExpress will not be released in Europe. This is done because the Lynx is far more popular over here, and because the PC Engine never made it to Europe! This means that here, in Europe, NEC is out of the race and the Lynx has won again!!! Hurrah!!!!

More and more shop's are selling the Lynx in Holland, the shop's that are selling the Game Boy are now selling the Lynx along with it.It will not be long untill the Lynx will have won definately (The price has already dropped from HLF 500 to HLF 300, the Lynx II will be HLF 200)

A Portfolio II is in production. The only thing we know about it is that it will be an improved version of the old model. More info when we have it.

Release dates for the Lynx II have yet to be set(for Europe), but we expect to see it in England this Christmas, and early 1992 in the rest of Europe. In the US it has already been released, at $99,-.

Here follows a list of the Lynx games currently available. if a game is not yet for sale at your local dealer, you know that the game is on it's way. Here comes:

California Games Rampage
Chip's Challenge Klax
Zarlor Mercenary Gates of Zendocon
Xenophobe Electrocop

Gauntlet III Blue Lightning
Slime World Paperboy
Road Blasters Ms.Pacman
Rygar Shanghai
RoboSquash

RoboSquash - LYNX Review - OUT NOW

Remember PONG? No? Well, think back, about ten years back. Pong, a game where you slide your bat to the left and to the right to catch a bal, which then bounces away the blocks above.
RoboSquash is exactly the same, except for some gameplay enhancements, and the addition of an extra demention. In other words, RoboSquash is 3-D Pong with power-ups. You can play against the computer, or challenge a friend.
The latter is the only thing that makes RoboSquash reach the AVERAGE accolade.
And this is indeed a very average game, almost below average.
PONG was great when it was released.... in the beginning of the '80s! But please, leave these games in the decade where they were born! Get real! it's 1991 and an improved version of Pong is just not enough to keep today's gameplayers happy!

Graphics _6 : Simple but functional
Sound _3 : Sound hasn't improved much since Pong!!!
Playability _7 : Quite playable at first
Lastability _4 : After a few goes inerest starts to wane
Overall _5 : A pathetic attempt at resurrecting an ancient game

Blue Lightning - LYNX review - OUT FOR A LONG TIME

Blue Lightning is out since the beginning of the Lynx, it's a good flight-simulator and demonstrates the great scaling features of the Lynx.
The game play is good (very fast play), but it does not really stand out from the other flight simulators. There are nine missions, each with a different goal like attacking radar bases, nightflights and dogflights.
There is no music, but who wants to hear music, you're supposed to be flying an airplane, the only sound you hear are those of the plane and your gun.
Overall it's quite nice (graphics are stunning), but it's adviced to buy it at a reduced price, unless you really want it.

Graphics _8 : Beautyfull, detailled and fast
Sound _6 : No music but it does not bore
Playability _7 : Game play is very good/fast
Lastability _7 : Missions are just right (not to easy and not so hard so you give up
Overall _7 : Great, one of the nicest simulators I've ever seen

SWAPPING SERVICE

Here follows a list of games that are for sale, if you want to buy or sell games please mail to the address below (please state your address when you place

an add, your address will be printed too).

FOR SALE: Gauntlet III
Rygar
Xenophobe

These games cost $18,- including postage and packing, if someone
wants to TRADE them for NINJA GAIDEN or BLUE LIGHTNING that's ok.
All our games are brandnew and are beeing legaly imported!

Internet-address: a15@nikhefh.nikhef.nl

GAMING TIPS

Chip's Challenge
The code for level 144 is GVXQ. also worth a try if you are a maths freak,
is the code MAND. This will enter the hidden Mandelbrot explorer.
A tip on using it: all buttons have a function!

Xenophobe
The Poofer gun is the most powerfull. it may have a very short range,but if
you want to survive till the very last level, give it a try!

Zarlor Mercenary - a players guide:
At the start of the first level you'll find a laser, an auto fire and speed.
To destroy the most aliens you must put the palm of your hand on the lowest A-
button and press the B-button with your thumb, so you shoot your cannons and
laser at the same time (autofire is needed).

End of level guardians:
The first and second guardians are easy, just keep moving to avoid the bullets
(and lasers on, level 2) and don't stop shooting.
On level 3 there are 3 end of level guardians, just keep flying above the
center, so you can't be hit by the lasers, you'll be hit by all the mines and
bullets but if you use mega bombs you'll make it through.
On level 4 you must shoot all the balls first (watch out, when they explode
they will shoot one bomb at you) after you've done that you must shoot the
big ball in the center, there will be about ten ships coming out of it (mega-
bomb is adviced). Level 5 is not special, just shoot it and watch out for the
alien ships that fly around. Use all your megabombs on the last end of level
monster, when it still lives use your laser, so you can hit it any time you
like.

Shopping:
Buy whatever you need, if you have money left, use it to buy extra things on
the first 3 levels. Sell every thing you don't need after level 5, that's
where you make the most profit.

My high-score is 3,56 million Zarbits (Supreme Mercenary).

PORTFOLIO

This month only a small section, but we will have large reviews next month.

A hot item to look out for is the harddisk for the portfolio. This 20 MB harddisk is about 1cm high and easily clicks under the portfolio itself. this makes the portfolio about 2cm high, but it doesn't make it any bigger. The only problem with this item is the fact that it runs on batteries. the harddisk does make the storage capacity of the portfolio quite large,and therefore makes it more like a PC.
If you just love small machinery, you'll love this harddisk, but we doubt it very much if normal people will really find this thing worth the bucks.

Here's some hot news for programming freaks!!! A basic has just been released for the portfolio. PBasic, as it's called, is saved in compressed, downloadable form on CIS and GEnie, in a file called PBas1.zip. You'll need the archiving tool called zip to unzip the file first. To order PBasic 3.0 on RAM card (if you don't have access to a PC), send a RAM card of 64K or bigger size, and a self-addressed stamped mailer for return posting to the following address:

BJ Gleason
The American University
CSIS
4400 Massachusetts Ave. N.W.
Washington D.C. 20016

We'll have a full review on it next month. All I'll tell you now is that PBasic is compatible with Quickbasic, so that means that you can now program while on the run!!! Mega great!!! There are also some extra portfolio-only commands!! Just wait one month and you'll hear all about it!!

P.S. There is also a Basic in production made by Atari self (this will not be a public domain basic!).

Well that's all for this month. If you have any suggestions or tips for improvements in this newsletter, just mail us.

Yiri and Tjerk.

(P.S. If you want to join us you're welcome)

Bye.

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.apple2,alt.bbs

I am in the process of getting either an Atari 8-bit, an Atari ST, or an Apple // system to run my BBS on. I have decided to go this route rather than upgrading for it is much cheaper. However, I do realize the consequences of going with these older out dated computer systems. Can someone tell me which is the best BBS program for each one of these computer systems, and which setup (hardware wise) would be best to use. I would appreciate it very much. I pretty much know on most of the setups what is required, but would like to know more and would also like some Sysops opinions on the different BBS packages if possible. Phillip Keen

2976. Spectre customized keyboard maps

Newsgroup: comp.sys.atari.st
Date: 1991-04-14 00:30:47 UTC
From: s37837k@saha.hut.fi
Message-ID: <1991Apr14.003047.22760@santra.uucp>
Source record: 233034

Hi there!

I have a major problem with Spectre:

I made a customized keyboard map for finnish keyboard, named
it DEFAULT.KEY and saved it to the same level with SPECTRE.PRG.
There is a copy of it at the ETC-folder also. All this is located
to my D: harddisk in a folder named SPECTRE. I launch my Spectre
from a SPECTRE.PRG icon located at the NeoDesk desktop.

First time I started with this keyboard map, the keyboard in
Mac-mode was all mixed up. The "Keyboard" -accessory does not
show the numeric keypad, it shows the old Mac Plus keyboard
with no keypad instead. The bottom line having Z, X, C,... etc.
has shifted to the left by one key, so if I press N, I got B etc.
And there is no space bar and almost all special keys, including
the space bar, act like RETURN.
The keyboard was ok (until I made this .KEY),
except </> and '/* keys were switched (the " ' " and " * " came
from lower left corner and " < " came from left to the Backspace),
so I tried to fix this, because I use these keys a lot.
After I made this .KEY file, it went mixed.
I also removed all files affecting to the keyboard layout from
my Mac system folder, and zeroed the settings for keyboard.

I tried to restore the situation before this, but no success.
No matter what I do, the keyboard stays mixed up.

So, please give me instructions how this .KEY file becomes activated,
what are the required operations/files/paths in ST-mode, and what
are the required settings/files in Mac mode.

The keyboard my ST has is the Swedish keyboard (it is the official
one in Finland too).

>some of my .prgs
>

The last release of the Jam Packer was V3.0 pre-release. This may sound contradictory, but V3 is such an improvement over V2 (even with a few bugs and no docs) that we had to release it.

There should be a new version along in a few months, but we both have very little free time at the moment.

To speed the release of the "real" V3.0 we would greatly appreciate receiving any bug reports on V3.0 pre-release. Particularly, what programs it doesn't work with, and how it fails. Indication of problems with the interface would also be appreciated.

2979. new uploads at atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-04-14 04:58:36 UTC
From: dcrevier@jarthur.Claremont.EDU
Message-ID: <11690@jarthur.Claremont.EDU>
Source record: 233033

I uploaded some dvi printer drivers for 24-pin printers. I had a hard time finding these, and finally found the drivers in Germany, so I thought I'd put them on atari.archive. The directions are in German, and I can't read German, but I got it to work by just unlzhing all the font files it creates in the directories it created. You need to unlzh it with an unlzh'r that knows about directories. I never figured out what the install program does. The files are:
24pin1.lzh
24pin2.lzh
and should be in atari/newitems on atari.archive.umich.edu

Now, a couple questions. About a month ago, someone mentioned a screen saver/mouse doubler from the makers of hotwire called hotsomething and said that they uploaded it to atari.archive, but I haven't seen it show up. Also, superboot 6.0 was posted, along with the sbsounds file, but the utilies archive file mentioned in the documentation hasn't shown up at atari.archive. Does anyone know about either of these, and if so, could you upload them to atari.archive?

Source record: 233027

Shiraz Shivji left a while ago. Leonard Tramiel (I don't know if he is head of R & D or not) has less authority than Alwin Stumph. If Alwin thinks that the TT should have a 68040, then he will convince Jack and the R & D team. I very much doubt what Leonard said. I think that eventually, Atari will be forced to use the 040. They cannot wait for the 050. They should not go to Intel because of architecture inferiority and incompatibility with their Motorla 68k line. The could and are going RISC. Atari U.K is developing a RISC computer. But I still think there will be a need for an 040 to bridge the gap.

Source record: 233028

Pagestream 2.1 will be out soon and will support the TT fully. Unix V for the TT will be out by summer. As for IBM emulators, there is a software emulator (that is supposed to give about 10-12 Mhz AT performance) is being developed for the TT and will be available to users of the TT free of charge and will be bundled with all TT's thereafter. Now that is the deal in Canada. I don't know about the U.S.

Source record: 233029

Well, I just bought a Mega STE. I know of TCB Tracker which is a 4 channel stereo (uses STE DMA) sampler. There is Quartet 1.5 There are some PD sound file players. There is Wrath of Death, Wrath of the Demon, I am not sure about Future Wars, White Water something or rather and some other demos that are very impressive. Oh, Deluxe Paint uses the 4096 colour pallete, so does Atari's new Hyperpaint 2.0, the Lexicor 4 graphics packages, some Tennis game of some sort and many others that I don't remember now.

2983. Atari Mega STE

Newsgroup: comp.sys.atari.st
Date: 1991-04-14 05:28:04 UTC
From: Shervin.Shahrebani.Of.250/744@f744.n250.z1.FidoNet.Org
Message-ID: <671694059.3@egsgate.FidoNet.Org>
Source record: 233030

I just purchased an Atari Mega STE 1 without a hard disk for $925 Canadian from a dealer here in Toronto. I love the machine and highly reccommend it. I plan to put in a nice 105 Mb SCSI Quantum hard disk later on. The new OS is nice, and so is the new control panel. The machine is fast in 16 Mhz with cache mode, very fast. Compatibility in 8 Mhz mode is excellent. HRAMDISK and some demos are the only programs that have not run on it so far. TCB Cuddly Demo was one of them (very much a surprise to me). In 16 Mhz mode with cache, most games don't run. Many productivity programs run, but I have not used all my programs yet. Atari is providing 1.44 Mb upgrades soon which should be nice.

S.S.

2984. GIF on ST/STE

Newsgroup: comp.sys.atari.st
Date: 1991-04-14 05:31:42 UTC
From: Shervin.Shahrebani.Of.250/744@f744.n250.z1.FidoNet.Org
Message-ID: <671694059.4@egsgate.FidoNet.Org>
Source record: 233031

There is a new program called DMJ_GIF.??? that will do a great job of converting GIFs that are especially high resolution like 640x400 and 640x480. The best converter around, even better than GIFSPC. But, with this comes a catch. Speed, this program takes three to four times as long as GIFSPC to convert a picture that is 640x480x256. I tried converting a pic in 16 Mhz with cache mode and could not tell the difference. But that is because I have only converted one picture on it before! I must try the same pic with and without the acceleration. Oh, the reason I mention that is because I am using a Mega STE 1. For all you MSTE owners.

>GNU agreement. I don't know.
>
Information in the files README-3.1.19 and COPYING from the
distribution for smail 3.1.19 names Landon Curt Noll and Ronald S.
Karr as the authors, and places it under the GNU General Public
License, which more or less says that all versions based on this version
are free and must be distributed with source code, with no charge
other than a nominal charge for making copies. (This is what I was
talking about when I mentioned the ``GNU Copyleft''.)

Possibly what happened is that the above two people took smail 2.5 (or
some other version) and modified it a lot, and then placed the whole
thing under the Gnu Copyleft.

>
>> I'd be interested in using this as the mail delivery agent when

>
>I think that for Minix you should compile the standard Unix Smail.
>

Assuming that my guess above is correct, that would be a good idea.
I like smail 3.1.19, but it would probably take up too many resources
for minix (i.e., ram, disk space, cpu cycles). If smail 2.5 is more
or less the same thing with fewer features (hence smaller, less cpu
intensive, etc.) it would be worth a try. The only problem is that I
assume that any archive sites with UNIX smail will have the latest 3.x
version. Where could I get the standard UNIX smail v2.5, i.e., the
version that was modified for TOS *minus* all the modifications?

2986. from Dave Small ...

Newsgroup: comp.sys.atari.st
Date: 1991-04-14 08:18:14 UTC
From: dsmall@well.sf.ca.us
Message-ID: <24197@well.sf.ca.us>
Source record: 233042

Many people I met at CEbit '91 requested me to post into here my
net address; please "follow back" the routing this message took to
get to you to find the way to my signon here at dsmall@well.sf.ca.us ...

Apparently I overwhelmed the email capacity of my signon on
the Well at 256K bytes while in Germany; many messages bounced, all of those
during March. I apologize; I was on vacation, and did not know the Well
imposed Email limits. (It's just as well; you pay for space above a certain
amount).

While I'm making an attempt to support users here, it's difficult;
many messages "bounce" when I try to reply, and I haven't the foggiest notion
why. ("unknown system ID? hunh?") I put most of the effort into supporting
questions on comp.sys.atari.st simply because about 50% of my email replies
bounce back to me and never reach their destination, whereas atari.st makes
it there.

During times of heavy software development or colicky children I'll
periodically "miss" here; it'll happen. I apologize in advance, but I'll try.
For instance, it's currently 2 AM here, and I'm due to visit my mother in law
tomorrow.. *gack*..

In response to the 1.44 mbyte question, I have no idea how a 1.44 meg
drive could work; we have no, zero, zip software support in it in Spectre
3.0.
Perhaps Apple installs a device driver for Apple File Exchange? You got me.
The step rate can be altered if you go after Spectre with something like
MacsBug or TMon, which are becoming available in Spectre compatible
versions. In the meantime, until Atari or someone sets a high density
standard, we don't know what to do -- support 78 different boards and
controllers? Support thr few 1772's that work at high speed? I don't know.
We did reserve shift F1 and shift F2 for mounting high density, but that's
it; there is -no- code "hooked in" to those keys right now.

In response to the 68030 question, the 68030 SST is coming along quite
nicely. We're doing final tuning of the "George Memory Unit" controller,
software compatibility testing, and entering Beta testing phase. We've toyed
with 50 Mhz, but the overall system gives better throughput at 33 Mhz due to
burst mode being available at that speed, so we'll probably "top end" right
now
at 33.
The performance is still quite interesting; I'll post some Q-Index
benchmarks
(or dhrystones, whatever ...) as soon as we get the boards "cast in concrete"
to
what people will be getting. That should occur within this week; we wanted

to test at 50 Mhz due to many requests at CeBIT.

As always, if UseNet mail doesn't get through (likely), our fax
is at (303) 791-0253, and has a patient, attentive manner.

Sorry for the length of the message; lots to cover.

Dave Small / Gadgets by Small / Hey, it's my birthday

2987. who can fix this in U.K. ?

Newsgroup: comp.sys.atari.st
Date: 1991-04-14 11:46:25 UTC
From: leroux@sievax.enet.dec.com
Message-ID: <363@uninet.vbo.dec.com>
Source record: 233036

Yesterday, after having loaded a new disk, my son lost the control of his
Atari 512 STe . We cannot input anything from the keyboard or the mouse.
Disk drive is functioning normally. This is a brand new computer serial number
A10AA 3043174. We reset the ST and the problem remains. We can do nothing.

This looks like a virus problem. I am resident in U.K.. Do you know who I can be
in touch with in order to fix this problem?

Thanks & Regards

Yves

2988. Help with MiNT/MGR - I'm confused!!

Newsgroup: comp.sys.atari.st
Date: 1991-04-14 14:20:35 UTC
From: bill@sugaree.uu.net
Message-ID: <74.28086533@sugaree.uu.net>
Source record: 233155

hi,

I am in need of help with MiNT and MGR. I know that they will work on
my system configuration meets the minimum requirements - I have a 520ST with
2.5 meg and a 30 meg hard drive. I down-loaded the two of them from GENIE,
(which, by the way took forever even at 2400 baud), and am having trouble
getting MiNT/MGR to operate correctly.

Okay, here's the root of the problem... I can get both MiNT and MGR to
start, but each time I try to open a window in MGR I get this "Cannot
get pty" - quite frankly I have no idea what this means and have no
way of finding out. The documentation that came with the two sucks and does
not offer any real information. Heres my second problem; I cannot figure
out way the commands that tell MGR/MiNT where to find its own programs to
work, Ex: "make mgr INSROOT=<directory info> TARGET=<directory info> install"

What I am looking for are clear, simple instructions for setting up and
using MiNT and MGR on an Atari, because I couldn't get what I needed from
the existing docs (thought they were cryptic).

If anyone out there is willing to help, you have my thanks in advance.

P.S. PLEASE NO FLAMING - I'm only looking for alittle help.

Bill

>

Whoops! You are correct that ProRebel is a hacked ACopy, but it is also an
illegal product. The one which I was describing is called ProGem, and is also
an illegal product. Both have their origins within the Pirate subculture.
They are both quite similar: They combine different versions of the same
copy program under a common front end. They both allow one to create a file
containing both the data and copy protection info from a disk. These files
are then arced or lzhed and uploaded to boards.

Sorry about the errata. I do not question your use of the program, I just
wanted to make sure you knew where it originated.

Incidentally, the reason that several versions of the same copy program are
desired is kind of weird (at least unique to the ST, to my knowledge).
Basically, if you have version 1.1 of some copy program, it can copy some
set X of programs. If you get 1.2, it can copy some set Y of programs.
However, even though 1.2 is newer, it is not generally true that X is
contained within Y. That is, the older one will copy some stuff that the
newer one cannot?!? Strange, as you would think that the newer versions
would only add capability . . .

2992. help with TT/GDOS/TTM195 setup

Newsgroup: comp.sys.atari.st
Date: 1991-04-14 19:07:11 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <23517@know.pws.bull.com>
Source record: 233040

For about 2 months, I have been using the following assign.sys file with my TT and a PTC1426 colour monitor. When I switched to a TTM195 mono monitor, I could no longer boot my system with GDOS (a screen message would say that GDOS 1.1 was resident but 2 bombs would appear during the desk accessory loading step). I tried rewritting the assign.sys file dozens of ways (see the example at the end of this posting) but the system still crashes. What the heck do I have to have in my assign.sys file to get GDOS to load properly?

For netland information, YES, all the drivers and fonts ARE in the path specified by the path statement! The fonts (except metafonts) and drivers are from my Timeworks DTP software. The metafonts are from my LDW software. Crashes occur even when I strip all AUTO programs out except GDOS and when all accessories are inactivated. Crashes occur whether or not NEOLOAD is run from the AUTO folder.

If I do run NEOLOAD, when the system crashes I get the following diagnostic page:

A bus error occurred (2 bombs)

d0:00000000 a0:21FC0000
d1:00058E62 a1:00E37F00
d2:00000000 a2:0005A0F0

```
The following files were sent to atari.archive.

19840 fcalc25.lzh - Financial calculator with GEM interface.
3072 muzak.lzh - Plays a tune in the background.
7009 panic.lzh - Shoot-em up. No docs. Works in all resolutions.
60416 sb_other.lzh - Some utilities for use with SuperBoot 7.0.

BTW, that STARWARS animation at atari.archive is excellent. And if you're
looking for a terminal program that doesn't need any special emulation,
DTerm is great. It's built-in Zmodem is also excellent. Thanks to whomever
uploaded these files.

Atari stock is traded on the American Stock Exchange (AMEX). Friday's
close was 2-7/8 (two and seven-eighths U.S. dollars per share). If you're
interested in investing, talk to a Canadian stockbroker. You should know
that there may be a minimum trade (perhaps in the hundreds of dollars)
and you should expect to pay commissions.

Hi Phillip,
About running your own BBS. It can be a real pain in the axx
(well... you know!); while occassionally it also has it's rewards. To "do it
right", you will need a few basics; a computer just for the BBS (not one that
you "share" with the BBS part-time), a hard drive and a 2400 bps modem (any
slower a modem, and many users won't even call!). Any of the three computers
you mentioned (an Atari 800XL/130XE, Atari ST or an Apple IIx) would work great
for running a BBS. Which one to use really depends on if you have a spare one
of these lying around unused, or can acquire for the least amount of money, or
have a preference for a specific BBS software. Look around, the style of BBS
YOU like and which computer you can afford to setup, will be factors.
As for the Atari 8-Bits, there are really only two realistic choices
for BBS software; BBS Express Professional and Carina II (2.5). Both the
SysOp's of CII and Pro love to flame each other over which one is better, but
both are excellent systems as each as both advantages and disadvantages.
Both CII and Pro have networking, capable message editors and U/D
sections. Also online games and databases. No matter what anyone tells you
(gee... does this include me? :^)), niether one is "better" than the other.
Now of course, I have my personal preference; but then I have been
running CII for three years now (was that subtle or what?!). For CII "looks &
feels" the way I want my BBS to "look & feel". It is written in BASIC, so I
can modify (easily!) to my heart's content; both BASIC and SpartaDOS are
available remotely so I modify from anywhere while I am out of town. In three
years CII has never crashed (although the MIO did go POP during a heat wave!),
CII can be safely called "bullet-proof".
Pro has many of these features too, although I am not as knowledgable
about Pro as I am about CII. Hopefully someone here on the net is a Pro SysOp
and can give you (and all of us) more insight into the workings of BBS Express
Professional. I hope this helps, bye.....

> Does anyone on the net know of a utility which would allow me to
>convert a bunch of GEM (*.FED) fonts to GDOS format? I use Uniterm V2.0e 011

yes. i wrote one recently. it is very simple. just swap bytes in all word/long values. i thought i might have posted it with manpager, but maybe not. if you can't write your own, mail me and i'll post it. now that i think of it (since i don't have GDOS), i wrote it the other way 'round (GDOS .fnt -> GEM .fed). still, the transform is symmetrical in that applying it twice gives the original file. GDOS uses (goofy) intel byte order...

Source record: 233045

I have a chance to purchase a micropolis (i believe)
1.2 gig drive. I would like to hook it up to my ST and
use it for MAC via my GCR. I figure i can hang it off
my thru port on my Quantum/Supra host set up.

I was reading in the 3.0 update manual that Spectre's formatter
maxes out at 256 megs. Does this mean i have to get the drive
preformatted for MAC? also.. will i have any trouble hanging it
off my Quantum/Supra etc etc..

thanks
cheers!

This is not an attack on this sender per se, but on the people who send out
'please buy my xxxxx box' type articles in general.

Why, oh why, do people not realise that comp.sys.atari.st is an INTERNATIONAL
news forum and it is highly unlikely that people outside of their locality
will want to buy what they are offering. In the UK we have a distribution of
'uk' to restrict where articles get sent to - I assume there are similar
country and county/state sized distributions in the rest of the world.

It's not too much to ask is it ... ?

I read something in one of the Amiga newsgroups that the ROMs are available from Apple's Pacific distributor in Hong Kong for $25 (no typo). Also, Toad Computers has them, but they are a bit expensive. I don't have their number available, nor do I have any other info about Apple's distributor, unfortunately.

(Apparently, Toad bought some Macs and took the ROMs out. :^)

Try out Mupfel that comes with the Gemini stuff, it allows "/" to be used
instead of "\" and has many csh like features. Also, it doesn't remap the
keyboard (which make Gulam useless on my Australian (uk? us?) keyboard).

Just FYI, in the March 1991 issue of ST Informer there is an article on how to connect a 1.2gig drive to the ST. I did not read it in detail, but the guy did succeed. You may wish to order this issue to check it out.

Without question the best BBS I have ever seen - on any system, is
Morgan Davis' ProLine system for the Apple II. I run it on a IIe
suped up with an 8mhz zip chip. It runs for weeks sometime without
my paying any attention to it. It supports Usenet newsfeeds and
outside email connections, the software upgrades arrive electronicly
via remote copies, the code is almost all in AppleSoft basic, which
makes bug fixes and additiions relatively straightforward. And to
top it off the environment includes a large portion of Unix-style
commands and a cshell subset. You can get more info from
mdavis@pro-sol.cts.com (...crash!pnet01!pro-sol!mdavis).

everyone else's.

3011. Desk accessory blues (re-post with corrections!)

Newsgroup: comp.sys.atari.st
Date: 1991-04-15 03:43:44 UTC
From: marshall@cs.uq.oz.au
Message-ID: <786@uqcspe.cs.uq.oz.au>
Source record: 233164

Sorry folks - my previous posting got munged. Here is it again:
I use DESKMG33 to allow me to select the required combination of auto progs, accs, desktop.inf and assign.sys. It works fine.
But I downloaded OKAMI from Stuttgart, Deutschland (I think) and tried to run it without reading the docs carefully (my German isn't too good!). It comes with a prog called GEM.PRG, supposed to give access to *.accs from the shell. When I ran it, the menu bar didn't show any accs, and the system froze. I had to reboot (from h/disk). But it went into a non-terminating loop of auto folder programs load and reboot.
If I selected a setup without accs, from DESKMGR when it loaded from auto, all was well. But any setup with accs went into the lousy loop.
I thought at first that idle.acc was the culprit, so i dragged it to trash - and all my files on h/d C: disappeared. When I reopened the C icon, they reappeared! Weird!
Should I trash all my accs from the h/disk and recopy them from backup? Or will this risk munging the disk? Do I have a virus? If so, how can I kill it?

>to GIF and Degas also IFF and MacPaint and some more.

I have got problems using the spc format too. This is since I built in
overscan. This is realy strange. Because it won't work even *overscan*
is turned off. So is there any hope? I realy wou like to get my
256 colors back. This is a lot better then 16. (was :-( )
On the ather hand - is there a way to use, at least, 16 colors while
using the features of *overscan*?

grettings to all of you

3016. RE: who can fix this in U.K. ?

Newsgroup: comp.sys.atari.st
Date: 1991-04-15 06:46:55 UTC
From: leroux@sievax.enet.dec.com
Message-ID: <365@uninet.vbo.dec.com>
Source record: 233186

Thanks to R.LUNNON@qut.edu.au

He help me to fix the problem.

In fact, it was a faulty joystick in port 1. The fire switch was blocked ON.
Consequently, this disables the keyboard and the mouse.

Recommendation:

If your keyboard and/or your mouse doesn't have any action, disconnect any
device in port 0 or port 1 and try a program using the keyboard.

Thanks one more time

Yves

3017. Why does GDOS/ AMCGDOS slow down midi output?

Newsgroup: comp.sys.atari.st
Date: 1991-04-15 07:36:42 UTC
From: geert@ahds.UUCP
Message-ID: <1953@ahds.UUCP>
Source record: 233166

I recently installed a program that uses GDOS or
AMCGDOS. When I did this, some of my midi programs are slowing
down there output to my midi instruments.
I think that only midi programs, that are using
atari's midi out TOS call (as i remember it Midiws()), are
slowing down there output.

Is this because there are some additional functions added by
GDOS/ AMCGDOS and the ST must search into a table to lookup
some routines, also the ones in the ROMS?
If this is the clue, why can't GDOS bypass the default routines
,which are normally in ROM, immediately and uses the GDOS
functions afterward? It seems to me that GDOS first looks
if there is a GDOS function called and then passes to the
default ROM functions if a not GDOS call is called.

Is there a GDOS version available, which hasn't this problem?
Any suggestions out there?

Thanks in advance.

3020. mono moniters

Newsgroup: comp.sys.atari.st
Date: 1991-04-15 09:00:36 UTC
From: esj@harvee.UUCP
Message-ID: <5572816@harvee.UUCP>
Source record: 233158

I am thinking about getting a monochrome moniter for my st. I was going
to get atari's monitor but I wonder if that is the best choice. as I see
it, I can:

a) buy a an atari monochrome.
b) buy a grey scale multisync.
c) sell my sc1224 and buy a color multisync
d) lament about all the really good software that runs in mono only.
e) ??? ideas from the net

I need to keep my cash output to about 200$

so, I am looking to the collective wisdom of the net as to what is
the best option for obtaining monochrome capabilities.

Thanks in advance.

In article <1991Apr12.054754.7583@uokmax.ecn.uoknor.edu> kllove@uokmax.ecn.uoknor.edu (Kenneth L Love) writes:
>
>This summer I'm going to be teaching myself how to program in C. My
>biggest (and brightest?) question is: "Which version of C is the best?".

There are only 2 'versions' of C ANSI and K&R. The 2 are fairly similar and it is easy to get a compiler for either version. At the end of the day the differences are cosmetic so it doesn't matter.

>I realize that many factors could influence my (or someone else's) opinion.
>So, I'm going to list a few.
>
>The code must be somewhat portable between systems (i.e. Is there a standard
>and how far do the ST versions diverge from it?)

There is a standard, and the ST versions I've used don't diverge from it (why else bother with standards?).

>The company support must be existant. {I think that is self-explanatory.}

Dunno about this, I use Sozobon which is PD.

>Are there good books available for the learning of this version of C?
>(Or would any book on C be sufficient?)

Depends on what you know. If you have a good knowledge of Pascal then I would recommend 'C for Pascal Programmers'. Mail me if you want more info on it.

>Would it be better if I knew something about the internals of the ST?
>(Is C like Pascal in that knowing the system hardware is uneccesary?)
>
>If I am fluent in Pascal, how difficult is C to learn?
>(Are they different conceptually? i.e. pointers = what in C? Does C have
> some things that Pascal doesn't? etc.)

Knowledge of the internals is only necessary if you want to do some low level programming.

C is fairly easy to learn from Pascal, the 2 being very similar (names vary and the symbols change, but there isn't that much difference). The above book is what I used to learn C, and I have to know it for University. C does have a few things Pascal doesn't (like bit level manipulation, and some intelligence) but thats about it.

>Is Turbo C going to be released in English? (I have NO desire to learn
>German, especially if all I was going to do with it was work with Turbo.)
>

>What kind of editor do the various versions use? (I like 'vi' over 'ed'
>anyday! :) (Is the mouse supported?)

Most come without any editor, and those that do can usually be used with any editor you want. I use First Word Plus because I'm used to it and like it.

>Does C use anything like a CLI or is it GEM only? (I use 'csh' on the Unix
>system here at Okla. U. Does C use a shell like 'csh'?)

This will depend upon what you buy. Many don't come with a shell, though some do. My own choice is either Mupfel (from Gemini) or Gulam if you've got the disk space to spare (the one I'm using is only about 70 Kb, which is all I've got to put it in!). Basically any shell you want will do.

>Can I use any of the versions of C without a hard drive? (I don't have
>one and it may be next fall before I do get one.)

Some versions are recommended for use with hard drives, though you can use most of them from floppy. Having said that you will probably require at least 1 Mb of memory for some versions, possibly more.

>How much does the language(s) and book(s) cost?

Again, this will depend on where you go. My compiler cost me nothing as its PD (and yes, I do recommend Sozobon). Books can cost anything, it depends upon who they are aimed at.

>That's all I can think of. (I think I hear cries of, "Isn't that enough?"...
>Nahhh... Couldn't be! :)

From: ytsuji@wucc.waseda.ac.jp
Message-ID: <5465@wucc.waseda.ac.jp>
Source record: 233175

GNU C is the best because it can become better than the best. If your
MWC is better, then I would just fix the source code of gcc so that
gcc could produce better code sequence as to that particular case that
mwc pointed at. People say gcc is inevitably poor because it does not
look after 68000 adequately because 68000 is now inconsequential. I
don't think so. m68k specific code can be added as much as one would
feel necessary: theres no limit to it. And I must mention the gnu assembler
is very good in terms of determining the shortest branch code etc.

3027. Re: Graphics on the STE - v. generally speaking...

From: wallmann@ipsi.UUCP
Message-ID: <1563@ipsi.UUCP>
Source record: 233178

This comes a little late but...
[In resonse to H.CHus Color graphics board]

I've been thinking about the same thing too, but my calculations
always came up with "too expensive". Of course if you think 16 MB isn't
expensive ... as you do in your post. While thinking about it I
had this great idea for a new RAM technology, which unfortunately
(then unbeknownst to me) already existed as dual-port RAM. Even then the
bus width needed and the cycle speed is just about too ridicolous for
a home computer. Personally I'd be happy with 640*400*16bit colors at
70Hz and some hires in mono. That would be monetarily feasible, I only
want color for the games <slobber> anyway, and some hires for programming.

I as a lowly long-time Atari customer, would indeed be already happy
over some _small_ improvements.
How about Player/Missile Graphics for at least the *&^% mouse cursor,
I can not believe that in the nineties we still got to erase the cursor,
draw something, turn it on again, erase the cursor draw something , turn
it on again (*)

Not neccessarily Atari specific:

Floating point is done in hardware (What %age of the user crowd
actually uses floating points (me NEVER!!) ?), but the stuff you'd
really need is done in software (probably in compiled Alcyon C to boot)
Programs like EZ-draw would definetely profit from a hardwired
draw routine for example. How about a microprogrammable stupid CPU,
that you'd just give instructions like
FOR(;;) ;; this is some mix between
IF IRQ pending ;; english, basic, lisp C and ML
GRAB BYTE from PORT0 ;; lisp for the comments that is
STUFF it into BUFFER at $XXXX ;; har har
IF BUFFERP == full signal IRQ LEVEL 2
CLRIRQ
END

That's basically perfect for sound processing, non DMA I/O processing
and maybe even so stupid tasks as memory initializing. And the 'real'
CPU with it's overkill of registers and cache and what have you
needn't worry about those bothersome context switches for every
*%^$ little interrupt.

Why is everyone so hung up about processor speed ? Sure it's nice that
the compiler does it in 5 minute, if it used to grind for 15 minutes
but chances are that a faster harddisk might be just as profitable
in terms of speed. How often do you compile, aren't you 90% of the time

just typing stuff into an editor ?? Personally I am quite happy even with
a lowly 68000 @ 8Mhz. Yes you speed demons it's allrite for me, IF the
rest of the hardware would do the job, I think a CPU shouldn't do like
graphics, I/O and sound!! My guess it that there just aren't enough
competant people in hardware R&D (anywhere for that matter) to do the
job. So they put in a faster CPU and delegate the rest to a cheesy
graphics card, which virtually does nothing except converting RAM
to colored dots.(the one Intel or TI chip I heard about maybe an exception,
but probably not). Ok this does not neccessarily apply to machines in
scientific environments, where one shittily written application is layered on
top of another (probably in some local LISP dialect) until the processor
croaks.

About every two years it gets to me and I write an article like that,
that's maybe because I would like to buy a computer and don't see
anything I'd like to buy. (Well that ST Notebook sounds tempting,
got yet to see one though...) thanks to the readers of comp.sys.atari.st
for taking it with some humor and letting the old man ramble on
a bit.
bye y'all

Nat!

(*)Probably the Amiga does that right

Ok, folks: here's the latest update on the bidding. Our
current high bid today for that amazing Atari package is: $550.

Remember, this is your last week to bid on the package. To recap yet
again, it contains:

Atari 520ST w/ 1Meg & mouse
Indus DS drive & a 5 1/4" drive
SCSI host adapter and cable
ComputerEyes Color Digitizer
COlor MOnitor
Mono Monitor
Lots of software

BTW, I will probably be posting a partial list of software later on
today, or maybe tomorrow.

Mike

Source record: 233177

```
|> Okay, here's the root of the problem... I can get both MiNT and MGR to
|> start, but each time I try to open a window in MGR I get this "Cannot
|> get pty" - quite frankly I have no idea what this means and have no
|> way of finding out.

I too would like some help getting MiNT/MGR to operate properly. If anyone
has some info, would you please post it. I'm sure there are many with
these problems.

I also had the 'pty' problem. Apparently MGR is looking for the SHELL
environment variable to figure out which shell to run. If SHELL is
not defined or points to the wrong thing, you get the 'pty' message.
I first 'setenv SHELL ...' and then run MGR and it works ... sort of.

I had MANY, MANY other problems with these programs. They may be related
to the fact that I am running TOS 1.0 (520ST with 4M memory).

1) MiNT will not install by itself, especially from an auto folder.
Most of the time it crashes because it can't install the proper
cookie (or something like that). I wrote a little TSR to install
the cookie and I can get MiNT up after that, but it is a major pain.
Sometimes MiNT crashes on startup because, it says, something is
trying to kill it. Sounds paranoid to me.

2) After I finally get MiNT running, I run a shell (GULAM) and set the
HOME, and SHELL environment variables, then run MGR from the shell.
Mgr starts up, but does not execute the commands in mgr.rc, which
is in the HOME directory. When I create a new window, it starts up
a bash shell, but everything is very unstable. The system crashes if
I try to open another window, or give just about any command besides
'cd' or 'ls'. After I open a window, I can see the cursor blinking
over on the left side of the screen.

3) As an aside, what is supposed to be the default bash startup file on
the ST? I can't create '.bashrc' on the ST, and bash.rc and other
obvious guesses don't work either.

I (and apparently others) would greatly appreciate some help from someone
who has this stuff working. It looks like wonderful software, if it would
only work. Sorry for such a long message.

>

Apparently, (and unfortunately), I think Regent Software went out of ST business. BUT, apparently, a dedicated user of their materials, has taken it over.

REGENT BASE is really good in many ways. One of the best ways was in the fantastic user support given by Frank Cohen; such support was important because the documentation was poor. (To give an idea as to the wonderful support Frank gave, I was a problem I could not solve; he had me send him my application; he found a bug in Regent Base itself, made the correction, and sent me the corrected version! Can't be beat!)

The other problem was speed.

BUT, once you know what you are doing, it is pretty nice. Again, the learning curve, at least for me, was steep.

If you are wondering where to get present or past copies of Z*Net or ST Report, they can be found on the Cleveland Free-Net. There are issues from a little over a year on the system.

You can access the Cleveland Free-Net by "telnt 129.22.8.75".

The past Online Mags are located in the Atari SIG (go atari) in the Atari Library (option 9).

Mikail at C-LAB says you see about a 20% increase in
speed with a MegaSTe.. less than what one would hope..
due to the fact that you have to disable the cache
to run NOTATOR.. once you do that .. the MegaSTe doesn't
seem to do much better than the 8 mhz ST's... i am told.

cheers!

3036. G-Print demo available on atari.archive (and GEnie)

Newsgroup: comp.sys.atari.st
Date: 1991-04-15 20:37:45 UTC
From: stephen@oahu.cs.ucla.edu
Message-ID: <1991Apr15.203745.5139@cs.ucla.edu>
Source record: 233193

I've uploaded two new demos of G-Print to atari.archive so I'm going to repost the program's description below. You won't see this again unless I post a new version.

gprnt_dmo.arc is a demonstration version of G-Print which can print to let you see the quality of G-Print's output. It prints "G-Print demo" on each page of output. This demo requires that you already` have GDOS (or G+Plus) and a printer driver with fonts.

gprnt_ox.arc is the G-Print "option explorer." It lets you try out G-Print's functions without having a copy of GDOS with drivers and fonts. The option explorer won't print, but it will display a snapshot of a G-Print screen preview with screen fonts loaded.

Changes from version 1.02:

Mostly small bug fixes. Problems with title pages using multiple columns, custom spacing, and page borders, and landscape printing have been fixed. Command keys for the "Special" menu options have been added.

The demos are available on atari.archive in the ~atari/newitems directory.

Here's the announcement:

Announcing G-Print, the GEM-based print formatting program for the Atari ST.

G-Print, which is now shipping, reads files from ST Writer, Word Writer ST, 1st Word, and 1st Word Plus as well as straight ASCII files. It then prints them with a variety of formatting options using GDOS printer drivers and fonts.

Here are _some_ of the things G-Print can do:

* multiple columns * multiple fonts * landscape format print
* title pages * rules and borders * saved configuration files
* run word processor * screen preview * "booklet" print
* microspace justification

Landscape print allows you to print spreadsheets with much more than 80 columns. Even prints on legal size paper in landscape mode.

G-Print also has the unique ability to remap special text effects so that light print, say, can be printed as outlined or in a special font.

In its fully functional distribution, G-Print provides GDOS and an easy to use installer program, but a demo version which requires GDOS and a printer driver with fonts is available on atari.archive in the newitems directory under gprntdmo.arc. A non-printing demo which doesn't need GDOS is under gprnt_ox.arc.

G-Print is available for US$27 + $2 S/H

Date: 1991-04-15 21:02:41 UTC
From: sytang@boulder
Message-ID: <14250@ccncsu.ColoState.EDU>
Source record: 233199

Isn't each issuse of znet more than 10KB or so in size? Wouldn't it waste a lot of banwidth to send it all over the world? Atari.archive.umich.edu has archives of znet under the magazines/znet, would that be more efficent way? Also there is a mailing list for individual want to receive it when greg got it, thats how I got mine and probably how atari.archive got it too.
I'll check for the mailing list address and post it, or maybe Greg is watching can post it
.

3038. ghostscript, dvips on ST

Newsgroup: comp.sys.atari.st
Date: 1991-04-15 21:21:32 UTC
From: timothyg@ncsa.uiuc.edu
Message-ID: <1991Apr15.212132.17492@ux1.cso.uiuc.edu>
Source record: 233200

Hi,

This is my third attempt to post this info. I'll get it right one day.

I have a partial port of ghostscript (GNU project's postscript interpreter) running on the ST. I know of one small bug, but as soon as I get gdb working, I hope to exterminate it. I currently have only the HP DeskJet driver working, but I think (hope) it will be simple to install any of the other drivers distributed with ghostscript (i.e. epson).

I am soliciting any information (about the atari and ghostscript) which might help me to write a screen driver for the ST. I am not very familiar with ST hardware, TOS, GEM, or the ghostscript device interface, so that is a tall order. Perhaps someone will volunteer to write it for me (wishful thinking). Is it possible to have a GEM screen driver for a non-GEM program? Can I hack one of the MSDOS VGA drivers?

I also have dvips running on the ST. Dvips converts TeX .dvi files to postscript files. It supports the use of TeX 'special' commands to include postscript graphics in TeX/LaTeX documents. The TeX/dvips/ghostscript combination can be very powerful.

I can post these programs (as they are) if anyone is interested and is willing to give me instructions for how to post executables. Thanks,

Tim Gallivan

Ok, I just got done reading the newest Z*nets, and I have a question. When was GFA Basic 3.5 released? I saw they have an update to it for the TT to ver 3.6. I bought 3.02 and the compiler a year and a half ago, and I haven't heard a thing from them. (I heard Antic is now in charge of it.)

So what should I do about upgrading? Should I try to contact Antic and find out whats going on? Any ideas?

>Without question the best BBS I have ever seen - on any system, is
>Morgan Davis' ProLine system for the Apple II. I run it on a IIe

I've never seen ProLine, so I can't comment on it, but I really think GBBS is a really good BBS system from using it. (And I've read a lot of the info on it because I was going to write a full-screen editor for one but unfortunately there are no arrays in the language it uses)

I've pretty much gotten out of the microcomputer BBSes though, except for getting new programs..

UNIX, cshell, the Internet and UseNet just seem to be a new dimension in modemming... non-networked (or minimally networked) BBSes just seem so "small."

Yeah, I realize ProLine can get a UseNet feed.

A pretty neat BBS for MSDOS systems (and it runs under UNIX too) is waffle. If anyone's interested in an Apple II version of it, send mail to root@darkside.com

I've wanted to port that program for a long time or have them port it as it's pretty good (they won't let me port it, but maybe sufficient outside interest will help it happen).

Its very nice that ZNET is available in a number of different places
but I'm quite sure there are plenty of people that do not have access
to it or else their sources can sometimes be unreliable(its happend
to me). And besides ONE message a week... ok ONE LONG message a week
is not going to waste bandwith. Its going to help people and if
you already get ZNET just press 'n'.

I'd like everyone to know that all issues of znet are archived
on atari.archive.umich.edu. They are available by mail-service
and anonymous ftp. There is little need to post a 60-70K article
every week.

This is not a flame, Jon knows my position on this matter. I'd just
like everyone to be aware of the above fact.

These ``calls for votes'' give the appearance of an attempt to follow
Usenet guidelines, but ... c'mon, Jon, are you joking? They were posted
less than four minutes apart!

> Date: 16 Apr 91 07:20:35 GMT (call No. 2)
> Date: 16 Apr 91 07:24:27 GMT (call No. 3)

(I also point out that the Usenet guidelines for newsgroup creation
have many more requirements than simply getting a majority.)

Please don't force 70-kilobyte ``magazines'' through the thousands of
systems carrying comp.sys.atari.st just to satisfy a couple of dozen
people who have not bothered to subscribe to the mailing list.

To be added to the list, send email to:

stzmagazine-request@virginia.edu.

Greg Lindahl has been running this service for a year or so.

>it on again (*)
:
>(*)Probably the Amiga does that right

I can not believe that in the nineties there are STILL people who want
hardware to provide anything but the bare essentials.

Hardware sprites are just crap. How many do you want? 16 enough? 256?
and how shall you allocate them to processes? They would be just another
pain-in-the-neck limited resource. But faster you say? Maybe in the old
days of 8-bit computers they were worthwhile: when the processors were
slow and the graphics was poor quality anyway.

"at least [for] the [fucking] mouse cursor" you say? Yeah, sure, then
EVERY game every made would use the mouse pointer as a sprite, sending
mouse motion packets to the OS to make it mouse. Hey, great! :-)

Ciao,
Warwick.

ps. Why do we whinge so much about our machines? From the crap PD stuff
I've seen around, and the crap commercial stuff, Atari users need to
learn a bit of computer science before they cry to the designers about
missing features. Personally, I think the ST is a fine machine.

3057. Weird TT hard disk thingy

Newsgroup: comp.sys.atari.st
Date: 1991-04-16 09:53:06 UTC
From: boyd@pipe.cs.fsu.edu
Message-ID: <1991Apr16.042133.20872@mailer.cc.fsu.edu>
Source record: 233114
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

My friend managed to get his external Supra HD connected to his TT (which has an internal SCSI device). The TT differentiates between SCSI and ASCI devices. The internal drive is set at SCSI 0, so my friend set his Supra at SCSI 1, so they would not confict. This turned out to be the problem. BOTH drives had to be set to SCSI 0 to work. Extremely weird. Anyone have an explination?

This issue is a day late. April 15 was a taxing day. (Sorry, but the pun
is mightier than the sword.)

I am currently looking for information on Atari ST magazines to be included
in the next 'welcome'. Please send me e-mail with titles, subscription
info, mini-review of the general contents, whatever.

DIRECTORY (new articles and articles with changes are marked with an '*'):
You may search for the capitalized keywords to find the related article.

WEL
Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, and STacy.
There are also emulators for the Apple Macintosh and IBM PC/XT/AT available.
Finally, there is the Lynx (a game machine) and the Atari TT and ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:
```

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

CSAST
What sort of articles would interest people reading comp.sys.atari.st?
==========

The most interesting articles are technical articles, impressions of software/hardware, information on Atari user-groups and shows, or helpful hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better than...', especially when cross-posted outside of comp.sys.atari.st. If you don't know how to eliminate other newsgroups from a reply to an article which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local distribution of comp.sys.atari.st. Those outside the United States have little desire to read about that neat bit of [hard/soft]ware you're selling when you live in the U.S.A. If you don't know how to restrict distribution of a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

PD
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter password>
cd /atari

For anonymous FTP in the UK: uk.ac.lancs.pdsoft

User pdsoft
Password pdsoft

This is a national public domain archive, available to sites in the UK only via JANET. Mail access is available from within the UK - send mail to archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: ftp.Informatik.Uni-dortmund.DE
[129.217.64.63]

Some selected Atari ST software is in the directory pub/comp/atari-st.

NOTE: The server has moved from unido.informatik.uni-dortmund.de. FTP
requests to the old address direct you to the address given above. I do
not know the current status of the old mailserver, but would appreciate
learning if it still exists.

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU
programs ported to the ST (including ports of emacs and bash and an extended
version of bammis library for gcc) and also ports of software posted to
comp.sources.unix, alt.sources and comp.sources.misc.

For anonymous FTP in Europe: archive.cs.ruu.nl
[131.211.80.5]

How to get ATARI-ST/index from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be
a valid internet or uucp address. For bitnet users name@host.BITNET
usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between
about 20.00 and 0900 UTC).

ftp archive.cs.ruu.nl [131.211.80.5]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
cd /pub
don't forget to set binary mode if the file is a tar/arc/zoo archive,
compressed or in any other way contains binary data.
get ATARI-ST/index

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

For Mail Service:

For the panarthea mail server, see Steven Grimm's monthly posting.
Panarthea holds all of the comp.sources.atari.st/comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so.

ARCS
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are
binary files which may contain one or more other files in a compressed format.
Archive files usually take up less disk space, and for this reason have
become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive
program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the
/atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features
and quite a lot of documentation
lharc.arc
zoo_bin.arc

Julian Coleman recently (December 1990) uploaded an archive starter pack to
the atari.archive server. His announcement reads:

" I have just uploaded an archive starter pack to Atari.Archive. It contains
the following :

arc / lharc / uud / uue / zoo
U. Michigan monthly posting (05 Dec 90)

The file is 'starter.tos' and is in the form of a self-extracting lzh
archive, so only needs to be downloaded (in binary mode !) and run. The
archive contains sudirectories and needs about 350k when extracted."

This is probably the easiest way to get hold of the various archiving programs
if you have access via FTP and can transfer the binary file to your Atari ST.
The program is located in the main directory (ie. /atari/starter.tos)

There are also several GEM programs which act as 'shells' for the archive
programs. The most popular are Shareware offerings, also available on
atari.archive server. They are:

arcgsh35.zoo - written by Rainer Klute. e-mail will reach him
at klute@irb.informatik.uni-dortmund.de or
klute@unido.uucp, or klute@unido.bitnet

arcshl23.arc - written by Charles Johnson

Both are located in /atari/archivers

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use the command line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?' or 'h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

ERR
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1

```
Drive not ready.................-2
Unknown command.................-3
CRC error.......................-4
Bad request.....................-5
Seek error......................-6
Unknown media...................-7
Sector not found................-8
No paper........................-9
Write fault....................-10
Read fault.....................-11
General error..................-12
Write protect..................-13
Media change...................-14
Unknown device.................-15
Bad sectors on format..........-16
Insert other disk..............-17
Invalid function number........-32............1
File not found.................-33............2
Path not found.................-34............3
No handles left................-35............4
Access denied..................-36............5
Invalid handle.................-37............6
Insufficient memory............-39............8
Invalid memory block address...-40............9
Invalid drive specified........-46...........15

No more files..................-49...........18
Range error....................-64...........33
Internal error.................-65...........34
Invalid program load format....-66...........35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

```

PAINT
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

GDOS
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and
more)" by Douglas N. Wheeler from the atari.archive server. The file is
/atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server.
The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files
or font files (at least those supplied by Atari). You can get these files
with many commercial programs, such as Degas Elite, WordUp!, etc. You might
also want to check your local user group to see if they received a copy of the
WordFlair demo program (also available on GEnie). The demo program appears to
have the GDOS system and font files.

CLI
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor
BASH GNU Bourne Again Shell - available under MINT
ksh Korn Shell - available under MINT
gemini MUPFEL is the shell used by the gemini environment
okami a German shell with many useful utilities built in
pcommand an MS-DOS-like shell

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

TEX
Is TeX/LaTeX available on the Atari ST?
=======================================

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.0) has recently been made available on the
atari.archive server. The files may be distinguished from the other TeX/LaTeX
files in the /atari/tex directory by their date (posted in December 1990) and
by the fact that they are all archived using LHArc (.LZH suffix).

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

LANG
Public Domain/Shareware languages...
====================================

Check the atari.archive server under /atari/languages. Currently included:

abc
apl Demo and 'J' j_29.arc,apl68000.arc
forth Don't know which, I prefer BRADLEY FORTH
FORTRAN77 BC-FORTRAN version 'C' bcf.lzh
icon ICON icon2.arc,icon_bin.arc
modula-2 From Germany modula2.zoo
Sozobon C Most excellant

Elan
xlisp
xprolog
xscheme

GNUC
Is GNU C available on the Atari ST?
==========

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems. For more than minor programming, you may need to upgrade to 2 or more megabytes, as the GNU programs generally assume you've got plenty memory.

GNU C for TOS is available via anonymous FTP on atari.archive. It is also available via anonymous FTP on cs.uni-sb.de [134.96.7.254] and most of the other European FTP sites.

MINIX
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.

If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

DEV
How do I become a developer for the Atari ST?
==========

Contact Gail Johnson, Atari Rep Person, (408)745-2568

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you desire.

Atari has gone to a 2-tier developer membership. The 'higher quality' developer support goes to commercial developers, and costs $250. The 'no-hand-holding, no announcement of company future products, no access to discounted hardware' goes to noncommercial developers, at an initial cost of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill in an application form and a non-disclosure agreement. Contact Gail for more information.

ZNET
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

ZNET and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

PALS
ST Pen Pals list
==========

Simon Chappell is compiling a list of people interested in exchanging paper-based mail "of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.
s61304@uk.ac.psw.pa (NOTE: NO LONGER VALID ADDRESS...)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

Contact Simon at his paper mail address if you are interested.

BOOKS
What books are available for the Atari ST?
==========

TIPS
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already

have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

>(in response to a query about editors and C compilers)

I use CBREEZE with Mark Williams C. With a windows-based computer it's almost ridiculous to have to battle it out with VI or emacs. Sure, a gem based editor won't be available on other platforms, but if you know an editor on those other platforms then what's the problem? CBREEZE isn't a hard learn (move cursor up, move cursor down, use mouse to move scroll bars, no [ESC] 9 L here!) and it comes with a customizer for Mark Williams so you can link, compile and pass parameters to the MWC compiler directly from the menu bar. The docs say you can even customize it for other compilers (GCC, Sobozon) but I haven't tried it since I gave up on GCC. CBREEZE is a Michtron product, and they've moved so I can't give you an address. However, it's still advertized in ST mags so I'm sure you can find it.

Ultima VI: Will it ever live for the Atari ST? Does anybody know if
a) Origin is planning to produce it for the Atari ST
and b) Will Origin produce it for the ST?

And what about all their other great games? (The titles elude me, but they look good on the IBM...)

I'm not really much of a gamer at all, but, hey, who can pass up Origin?
(I don't understand why Ultima V didn't have MIDI sound...Ultima III did...)

3064. Re: Posting Z*Net International 3rd request!

> to this news group comp.sys.atari.st. Votes will close Monday the 22nd
> of April 1991.

Look, there is NO POINT posting Z*Net to this newsgroup. It's already
available to anybody who wants it, via mailing list.

It is also the case that some of the commercial plugs which appear in Z*Net
are contrary to the accepted usage guidelines of the Internet and of Usenet.
Expect controversy if you try to post it here.

In short, even if the majority are in favour of having it posted here, I
believe that it would be extremely inadvisable to do so. You might wish to
set up an alt group to gateway it, along the lines of alt.society.cu-digest.

mathew

>SO..... where can I get the latest, greatest version of M-Tools, and what
>should I look for to avoid the problems I have seen posted in the past?
>
The canonical version of Mtools is indeed posted at the .mil site mentioned in recent postings, but when I tried to FTP it (it is a 4-part set) one of the parts absolutely refused to transfer completely. It invariably truncated every time I copied it. I finally got a good copy at inria.inria.fr. The version I located is v2.0, and has support for CD, FORMAT, LABEL, and ATTRIB, plus a mkmanifest tool to assist in restoring unix file names that get lost in the translation to DOS file names.

3068. TIME cards, etc?

Newsgroup: comp.sys.atari.st
Date: 1991-04-16 15:58:27 UTC
From: pyr579@oz.plymouth.edu
Message-ID: <1991Apr16.155827.2260@oz.plymouth.edu>
Source record: 233115

Hello,

I been using an ST for around 4 years and have finally decided
it would be nice to have an internal (or cartridge based) time mechanism
to keep track of the time. All my files and things have the original
system time on them and it would just be nice to know WHAT time it actually
is when I'm on the system. My first question:

Does anyone have an old time system they want to get rid of? Sell?

Second question: What are peoples opinions for the BEST and CHEAPEST
(two categories) time systems?

Thanks,

~S

The Monitor Master doesn't have multisync support. It can only switch
between two Atari monitors.

3070. GDOS/TT/TTM195

Newsgroup: comp.sys.atari.st
Date: 1991-04-16 16:16:12 UTC
From: CSULLOGG@CRL.AECL.CA
Message-ID: <23575@know.pws.bull.com>
Source record: 233122

I want to thank Ron Grant, GXR Systems in Vancouver, for helping me out with the assign.sys format for GDOS to run on a TT with a TTM195.

The trick is to put 08p screen.sys to 10p screen.sys lines in, along with the fonts for the 04p screen.sys driver. Thank goodness that there are users out there who can help.

Can someone post the address of Fearn & Music from Stuttgart Germany. I need info on the init that lets me print to an SLM605 in GCR mode.

3071. Spectre GCR / ST Disks

Newsgroup: comp.sys.atari.st
Date: 1991-04-16 17:03:32 UTC
From: mike@mgc.uucp
Message-ID: <1991Apr16.170332.6533@mgc.uucp>
Source record: 233108

I'm after technical details regarding the way in which Spectre GCR (the superb ST Mac emulator) is able to read and write standard Mac format disks using only the standard ST drive. I was under the impression that Mac drives are variable speed, while PC/ST drives use a fixed speed system. Of course, I may be very wrong about this.

Any information on the subject (as technical as you like) would be greatly appreciated.

Chow,
Mike aka Baal the unsinkable.

(Imaginative footer still in development. Watch this space...)

Here's the first time I've seen any discussion about the screen.sys
lines above 4p. When I dloaded Rufus it had some fonts and lines
in the > 4p range (6-9p if I recall). Since I am using only a
monochrome monitor, can I remove these lines? Can I remove all lines
excluding the 4p (and the fonts under it)?

3073. Running Mupfel under Neodesk

Newsgroup: comp.sys.atari.st
Date: 1991-04-16 18:37:17 UTC
From: bill@mwca.UUCP
Message-ID: <1847@mwca.UUCP>
Source record: 233136

In article <779@uqcspe.cs.uq.oz.au> warwick@cs.uq.oz.au writes:
>Try out Mupfel that comes with the Gemini stuff, it allows "/" to be used
>instead of "\" and has many csh like features. Also, it doesn't remap the
>keyboard (which make Gulam useless on my Australian (uk? us?) keyboard).

I see some wierdness if I try to run Mupfel from within Neodesk - if I run Mupfel, then run Zoo from Mupfel, zoo gets executed twice. Also, upon exiting Mupfel I get put back to the desktop instead of to Neodesk (using the non-resident mode of execution). Doing a bit of experimenting, I tried running shell_0 in my AUTO folder, then running Neodesk, then Mupfel, and with that combination Mupfel won't exit at all (goes right back to Mupfel).

Any ideas?

Yes, it is being marketed this way for the Mac and IBM clones. But there is
something else. Tim Jenison (NewTek president) was recently quoted to say
that their goal was to produce a stand-alone Toaster for under $1000. They
plan on achieving this end by incorporating pieces of the Amiga into the
new "black box" toaster. I have heard they have already done some negotiations
with Commodore to create this product.

What did he plug the Supra into, daisy chained off the SCSI port, or
the Atari DMA port? If DMA port, then the answer is that you're using two
separate buses...

Silly me, I forgot to tell it the right distribution.
By the way, that should say Brooktree VideoDAC, not RAMDAC. A RAMDAC is what you use when you want to have a 256-color lookup table for 8-bit graphics. The Bt459 RAMDAC has a 256x24 lookup table for color information, 16x24 overlay color lookup table for easy text-over-graphics or windowing applications, and even a 64x64x3-color cursor in hardware (For those of you who want a sprite).

I hope this reaches more than just me this time...

No, Smail 3.x is definitely a fresh start. I'm not a 3.x guru, but
as I understand it, it was intended as a replacement for Sendmail.
Among other things, it handles multiple transportation methods,
while Smail 2.x doesn't.

> version. Where could I get the standard UNIX smail v2.5, i.e., the
> version that was modified for TOS *minus* all the modifications?

I'm afraid I don't know much about how to find Unix archives, but
you could ask in the appropriate Unix newsgroup, comp.mail.uucp, or
even comp.os.minix -- I wouldn't be surprised to find that somebody's
already done the work for you.

Last I saw, E. Arthur Brown had acquired a big pile of Michtron sw,
including CBREEZE, and was selling it cheap. (I actually prefer the speed
of MicroEMACS and a full, clear screen.)

The basenote asked about C compilers for learning. I think anybody who
wants to learn C and doesn't pick up Sozobon AND the free source code to
the libraries (dLibs) is missing a golden bet. I've learned more from
Dale Schumacher's code (and from Dale himself) than I've ever learned
from a book.

And as for commercial support ... don't place too much value on that.
They're not going to teach you how to code on the phone. If you have
questions, try comp.sys.atari.st.tech. And post code samples!

This may sound silly, but...

1. Boot without MiNT
2. Set preference to Medium
3. Save desktop

Try again.

Or have you already tried the obvious?

Source record: 233141

```
- I have the Mint/MGR package, and would like to know how to get it to
- start up in medium res. I have a 1040ste that like to boot up in low
- res. Right now I run quickst 2.10 to have it start in medium res, but
- when I go to gem from mint it comes up as low res, is ther a fix for
- this?? Any help would be appreciated...

This is a bug in TOS 1.06; TOS 1.62 fixes this minor bug as well as
some other things, but TOS 1.62 is not available as an upgrade.

Anyway, there is a program on the language disk called STE_FIX.
Putting this in the AUTO folder will have your STe boot in medium res
if the DESKTOP.INF is set for medium res. However, there is another
way....

Depending on how your personal DESKTOP.INF file looks, you want to
change the 12 in line 5 to 13.

#a060000
#b000000
#c???000?000<000?00;;400;0;;;4440??0;;?0?;0;;;0??03111103
#d
#E 90 13
^^
This tells the STe to boot in monochrome, but when you're running a
color monitor it goes to medium res.

3083. .Z compression for the ST

Newsgroup: comp.sys.atari.st
Date: 1991-04-17 00:42:36 UTC
From: ieb4826@rigel.tamu.edu
Message-ID: <14810@helios.TAMU.EDU>
Source record: 233143

Does anyone know of a program for the ST that can compress and
uncompress .Z compressed files. If there is one does it require a shell
or anything to implement. I've been downloading some astronomical gifs
that are huge and uncompressed with a 1200 baud modem and I'm getting
desperate!!!

Thanks in advance and for
help in the past...

E.Bou-saada

scale@abode.wciu.edu (Luis Outumuro) writes:

>
> Hi Phillip,
> <quoted text deleted>

Yes, I know it does. See, that's the problem now with the IBM is that I am needing to use the computer more and more while the BBS is up. So, that's why I am looking into getting a dedicated machine, and I named my options, because my options are the cheapest around town here. I am most likely going to go with the Atari 8-bit because I like how well BBS Express Pro supports ANSI graphics. See, all three types of systems (Atari 8-bit, Atari ST and Apple][x cost right around the same amount here in town with Apple][x being the most expensive, the Atari ST being the next higher priced, and the Atari 8-bit being the lowest). However, I suffer the consequences with the Atari 8-bit systems, and that is I would have to be buying ALL used equipment. If I were at least able to purchase Apple][x or Atari ST systems, I would be able to purchase it all new. So, I don't know which route I should go. See, I am happy with most everything I see in operation, so it makes decisions hard on me. This is why I brought the conversation to such a huge network community, to kind of help me decide which route to go.

Yes, thanks for the information about Carina II, although down here in Houston, BBS Express Pro is the preferred BBS package amongst Atari 8-bit computer systems. I might just give a Carina II system a call sometime. The Carina II system in town, NiteLight has been having some problems, so I might have to call out of town or something. There is one Atari BBS program I wasn't too happy with, but don't remember what it was because it's been ages ago since I've seen it. It might of been Carina for all I know. I'll have to check them out again... Phillip

>vt100). Even when I disable QuickST, it still does this. Only when I
>not load in QuicskST on autoboot does the problem disappear.

My brother has QuickST 2.10 (I don't know if he's updated to the latest version.). I used Flash 1.60 on his computer and I got the cursor left-overs as well. I told Darek Mihoka about it, but he didn't believe me. (Said something about it being a problem with Flash or that I was using an older version of Q-ST...) Obviously it is a problem with Q-ST 2.20 as well. Incidentally, Turbo ST 1.84 does NOT leave junk all over the screen, but it unfortunately disables the ability for Flash to display underlines.

>I've tried using some german program (called fixflash or something like
>that) but it doesn't seem to work. Alas, I have no docs to that program.

Does anybody know what this program (fixflash) does? If it fixes the problem with the underline in TurboST I'd love to see it on atari.archive!

>I'm not sure which program is at fault, but it sure is annoying. It even
>warrants me to boot Flash on my disk drive (yech!) as opposed to my hard
>drive so I don't have to reconfigure my autoboot programs there.

Why not use a program like SuperBoot or DeskManager? It'll make your life much easier in the long run!

About zoo: Check if it exists twice on your path maybe.

I run Gemini with Mupfel, then Uniterm within that, then Mupfel from within
Uniterm, then zoo from there and THAT STILL WORKS! Hmm. Maybe a strange
set-up, maybe Neodesk. When you "exit" Mupfel, it calls some "exit.prg", but
I don't really understand that bit (.logout maybe?)

I have tried both of the following, but they do not work when I am using Mint? I still come up in low res.. If I am not using mint I come up in medium res just dandy. Is there any way to get this to work from within mint? I like the changing of the 12 to a 13 in the desktop.inf better then the ste-fix program. They both work for normal non-mint mode....

Help...

Yes, I think there is a "compress" at atari.archive

GIFs are already compressed using the same algorithm that "compress"
uses. It's just that the files you have are probably BIG images, with lots
of detail - there's no way around it. See if there is a IBM PC at your
campus and FTP to 3.5" floppies (or kermit, or whatever).

3089. want advice re printer for 1040 ST

Newsgroup: comp.sys.atari.st
Date: 1991-04-17 03:45:18 UTC
From: kgg@zinn.MV.COM
Message-ID: <1286@zinn.MV.COM>
Source record: 233075

I want to buy a printer for my ST.
NLQ is a must, LQ would be fine if I can get it.
I don't think I can afford more than $250, would much prefer $150.
Another must is ability to dump images from screen to paper.
Finally, I hope to acquire some sort of PostScript interpreter/driver,
so something with enough flexibility that such a driver can be written
for it would be very desirable.
I don't need a wide carriage or color or lasers.

I've seen the Epson T-1000, I think it is, for around $150...
It *looks*, from reading the manual, like it can handle all my
requirements except maybe the PostScript stuff, maybe even that.
Anybody have any experience with this beast?

Anybody have any other recommendations?

Anybody have a used (but not worn-out) printer they want to sell?

Is it safe to say that anything that is sold to work on a PC
should work okay on the ST?

3090. Supra HD utilities..I need 'em!

Newsgroup: comp.sys.atari.st
Date: 1991-04-17 03:49:53 UTC
From: reyy@vax5.cit.cornell.edu
Message-ID: <1991Apr16.234953.4088@vax5.cit.cornell.edu>
Source record: 233126
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings,

I've just received a SupraDrive Hard Disk from a friend,
but I can't seem to get it working on my ST. I'm very
new at hard drives, so everything I've done is experimental.
About all I've been able to do is test the access speed with
HDCHCK13.TOS!

I think my problem is that I need a copy of the utilities
that go with the hard drive (i.e. Supra's utilities). But
neither my friend nor I have them. (is this assumption
correct? i.e., I can't use non-Supra utilities on a Supra
drive? I tried HDX and no-go.)

So, that means I need a copy of these utilities. Is there any
reason why someone can't mail them to me? (I've got the drive,
it should be legal to have the utilities, too!) If not, does
anyone have a copy they can send me??? Please???

FYI, my setup is (and don't laugh):
Atari 520ST
TOS1.0
1 DSDD drive, 1 SSDD drive
SC1224 Monitor
20 MB SupraDrive, upgraded to 50 MB (w/ a Seagate ST157N I believe)

Thanks,

>

I take it back what I said about having Znet posted up. A few people have taken the time to enlighten me. They said(and I agree) 1) there are some people who pay for usenet so they cant just press 'n' and forget about it 2) there are very,very few people who have access to usenet and do not have an email address so if you want Znet just ask Greg Lindhal 3) by the time the emag gets to you all the way from New Zealand its probably already at your local bbs or genie or greg lindhal has sent it. 4) Also They said that that silly little vote should be taken again. 5) And also according to They this was proposed some time ago and was shouted down for the above reasons

peace,
Milton Symister

He plugged it into the DMA. However, if it is a separate bus, then it
was the only device on it. So why does the Atari software demand that
it be device 0? That is what puzzles me.

Do many people have the ICD AdSpeed?

I recently put one in a Mega ST-4 with a Moniterm board and
it seemed to work pretty well. I left the machine on overnight
and it had crashed by morning. It seems that it crashed within
a few hours. The problem seems to be heat related, because the
system seems to get flakey after it's been on for a while.

Has anybody else experienced similar problems?

> Does anybody know if Borland Turbo C is available in English for the
> Atari-st? What is the latest revision?
> Where is it available from?
> Does Borland have a mailing address?

Turbo C/ST from Borland is not available in English.
The latest revision is 2.03.

So far I know! Now the actual rumors! ;-)

The rumors which are going around here in Germany say, that Borland is going to stop the distribution of Turbo C/ST and give the rights back to the Developer Team. It seems that they plan to make up their own company and carry on working on that C-Compiler which won't be named Turbo C anymore (guess why ;-)).
So far it seems quite sure, because even people from the Borland Turbo C Team said something like that.

Who's going to do the distribution and if there will be an English Version then, who knows???

>about Sir Clive's business acumen. The Timex, Quantum QL, Cambridge Computer,
>and Psion are all pretty good machines, but they had some quirks and were not
>supported by further development.

I just have to correct you at this subject!

The Timex computers where special versions of the sinclair ZX 81
and ZX Spectrum. Perhaps they didn't sell very well in USA, but were
some of the best selling micro(home) computers ever in europa (the spectrum
and its succesor the Sam Coupe, are still selling quite well).

The sinclair QL (the name is NOT Quantum QL) where fare ahead from
all other compters in it's days. Ok it was not as great succes! but there
is still about 100.000 users around the world.

Neither Clive Sinclair or Chris Shelton has anything to do with the Psion
computers (organiser I and II, MC200/400/600). All very fine computers,
but overpriced. On the other hand is the Cambridge Computer Z88 one of the
best selling notebook computer ever, and is still going strong (rumors says
that we soon will see a new version, perhaps the Z91?).

>I think Atari might be in a better position to deliver and support a marketable
>product based on the PgC chips, because of their experience with the Inmos
>transputer and Helios OS, which culminated in the ATW computer.

I totaly disagree! With a PgC7xxx in their hands, Atari would just make some
kind of ST compatible (with TOS and GEM- don't joke me!). If anyone are
going to make something radical new, then it has to be men like Sinclair and
Shelton. Personally I'm looking forward to see what they will come out with
(around fall/winter 1991 perhaps?)

I recently downloaded dmj_gif.lzh from atari.archive and found that
although it does create *very* nice spectrum pictures (and even show 'em to
you to prove it!) none of my other viewers (spslidex, and the couple in artpak
will load these pics....
this may only be true for the .SPC pics (haven't tried the .SPU) yet.
also, the program dmj_gifB.prg for converting interlaced gifs which is
mentioned in the manual is missing!

anyone else have problems with this software?

How about the time our modem spends downloading it? Modems can't just press
'n'.

If I recall correctly, another reason that this was shouted down last time was because of the advertising in Z*Net, which goes against the Usenet no-commercialism policy.

3102. Spectre GCR and Mega STE?

Newsgroup: comp.sys.atari.st
Date: 1991-04-17 14:46:25 UTC
From: eric@praxis.co.uk
Message-ID: <1991Apr17.144625.2533@praxis.co.uk>
Source record: 233093

I am thinking about treating myself to a Mega STE but before I sell my trusty STE and hard disc I want to know if anyone has used Spectre GCR with the new Mega (after a bad experience with my first STE and Spectre, I have become a bit wary).

So has anyone used this combination?

Similarly is anyone using one of the PC emulators with a Mega STE?

And while Ive got your attention, what do users of the new Mega range think of them? Good points, bad points? Incompatibility problems over and above the vanilla STE?

Thanks for any info. I will summarise to the net if appropriate.

Eric.

P.S. If I go ahead with this, it will be my 6th ST computer in nearly as many years. Will I never learn? :-)

3103. Cubase information sought

Hi,
I am posting this for a friend, so please send replies
to choueiry@liasun1.epfl.ch. I shall transmit. Thanks.
------------------------------------------------------

I am looking to buy a portable atari stacy (model 1 or 2)
in order to make use of cubase, but how does this stand
up to todays competition- I heard its still the best, is
this true ?
Is there something comparable available for the macintosh?

Burton Lewis

In this list, games have been rated on a scale of 1 to 10, 10 being the best and 1 being the worst. For each game, the total number of votes, the average rating, and the vote distribution are shown. New games are indicated by a "*" before their entry. If a "(C)" appears after the title it means that the game is a CD-ROM or disc system title. If a "(J)" appears after the title it means that the game is currently only available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the percentage of votes for each ranking. The following character codes can appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes
"1" 10-19% of the votes "5" 50-59% of the votes "9" 90-99% of the votes
"2" 20-29% of the votes "6" 60-69% of the votes "*" 100% of the votes

Please consult the article entitled "ABOUT THE VIDEO GAME RATINGS REPORT" in the newsgroup rec.games.video for more details, including information on how to vote.

Questions, comments, problems, and errors should be directed to the list maintainer at either of the below addresses:

3105. VIDEO GAME RATINGS BALLOT [ATARI]

Newsgroup: comp.sys.atari.st
Date: 1991-04-17 15:27:30 UTC
From: erc@radon.berkeley.edu
Message-ID: <41766@ucbvax.BERKELEY.EDU>
Source record: 233052
Cross-posted to: rec.games.video,rec.games.misc,comp.sys.atari.st

To use this ballot, just hit "R". Once in your editor, insert your game rating between the word "vote" and the system code and game title. Your rating must be an integer between 1 and 10. There must be at least one blank on either side of your rating. Make sure the word vote appears at the start of each rating.

If you do not want to rate a particular game, just DELETE THAT LINE FROM THE BALLOT. When you are finished, SAVE THE FILE, and exit the editor. The votes will be sent to the game rating tabulator.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

If you want to vote for additional games, just add them at the end, in a format similar to the existing entries. Be sure to include the system code right before the title. This code is one of the below:

AL = Atari Lynx AM = Commodore Amiga
GB = Nintendo Game Boy GG = Sega Game Gear
GS = Apple II GS MA = Apple Macintosh
NE = Nintendo NES and Famicom NG = SNK NeoGeo
PC = IBM PC, PS/2, and compatibles SG = Sega Genesis and MegaDrive
SF = Nintendo Super Famicom ST = Atari ST
TG = NEC TurboGrafx-16, TurboExpress,
and PC Engine

Thanks for participating in the rec.games.video ratings poll. (This text was adapted from Chuck Musciano's rec.arts.movies ballots and John Leo's rec.games.video ballots.)

PLEASE DELETE TITLES WHICH YOU WILL NOT BE VOTING FOR.
PLEASE DELETE TITLES WHICH YOU WILL NOT BE VOTING FOR.
PLEASE DELETE TITLES WHICH YOU WILL NOT BE VOTING FOR.
PLEASE DELETE TITLES WHICH YOU WILL NOT BE VOTING FOR.
PLEASE DELETE TITLES WHICH YOU WILL NOT BE VOTING FOR.

Yes, but why does this explain why it will not work with an id other
than 0? I can see that if TT SCSI and ASCI are seperate buses then it is
ok to use the same id. Does this meen that the TT ASCI port only
supports one device not the full 8 on the ST. If it supports the full 8
then with two buses or 16 SCSI devices the TT can handle some serious
backing storage :->

- I just purchased an Atari Mega STE 1 without a hard disk for $925
- Canadian from a dealer here in Toronto.

Congratulations. I assuming that the machine has the host adapter already installed. Is this correct?

- HRAMDISK and some demos are the only programs that have not run on
- it so far. TCB Cuddly Demo was one of them (very much a surprise
- to me).

The TCB Cuddly Demo doesn't work on the STe either, unfortunately.

-------------------------------------------------------------------------
|YO! I am looking for any information on Monitor UpGrades for the ST.
|
|If you have heard about it, used it, are selling one, or know the
|prices and where to get one please leave me amessage. I have heard of
|something called the Izack Board 1000*760 in color, I have also heard
|About Moniterm. My goal is to reduce the number of monitors I use, so
|the Moniterm is a great Idea, but still another extra, not a
|replacement. The Izack board sounds great, but I don't know what
|software utilizes 1000*760 in 16color low Res.
|
|If there are any other options out there I am VERY interested in
|hearing about them. The quest for the ultimate ST monitor system
|continues. If I gather enough information, Ill post any thing
|interesting. If you are interested in selling something, please leave
|me a description of the Item, What it does, and how much you are
|asking.
|
|send mail to.... neonman@ecst.csuchico.edu

3111. Zoo won't extract folders

Newsgroup: comp.sys.atari.st
Date: 1991-04-17 19:46:06 UTC
From: JJL101@psuvm.psu.edu
Message-ID: <91107.154606JJL101@psuvm.psu.edu>
Source record: 233064

The only thing I can get zoo to do is -extract. I cannot get it to use
any of the expert commands... it just gives me that bad command screen.
Is there something that I am missing? I try e, -e, along with the
/ to get it to extract to folders, but still the only command that ever
works is -extract, nothing else seems to.

Any ideas out there?

Thanks in advance,

Future Wars uses the enhanced palette and digitized sound. Unfortunately, the
sound data is recorded on the back side of the floppy disks. I don't know of a
way to install the game on a hard drive and still get the digitized sound.

Fine. You mention that the machine will run at 16 MHz. Are you *quite sure* about that (no offense, just that a certain nameless salesdroid tried to steer me into a IMHO overpriced Mega STe 2 with the claim that the STe 1 only ran at 8 MHz; I was *not* amused...)

Thanks, and please post your reply; I think interest in this point would be general.

3115. Odd monitor problem

Newsgroup: comp.sys.atari.st
Date: 1991-04-17 20:18:11 UTC
From: JJL101@psuvm.psu.edu
Message-ID: <91107.161811JJL101@psuvm.psu.edu>
Source record: 233057

On a monochrome monitor, I started getting these verticle bands of
1/2 inch or so horizontal tightly packed fuzzy lines across my screen.
They only affected white areas, not great areas.... they would fade in and out.
And then they would dissapear, this has only happened twice.... but I have no
clue what it is.... any ideas? Interference from something? A monitor problem
?
Any help would be appreciated!

Sozobon expects this really arcane method of passing parameters.
In the above example, try:

main(argc, argy)
int argc;
char **argy;
{
}

Someone told me that this is the old method of passing parameters.
One advantage is that you can say
void foo(x, y, z)
int x, y, z;
{}
instead of
void foo(int x, int y, int z)
{}

In other words, you only have to type int once. (Yay)

Yes a FREE COMPUTER (Atari 520ST computer w/1meg ram). But here is
the catch: The computer is free with the purchase of 100 Software
packages at $10.00 each. Total price $1000.00. Software titles include:

The Michitron series
the Habba series
the infocom series
kings quest II & III
space quest
karate kid II
baseball football basketball (by various vendors)
the teleriam series
silent service, gato...
lots of karate, driving, 3d shooting games
and many many many more...

Like I said, 100 titles (different and commercial)
most are unopened. All have original docs and disks.

Call me for details. I will ship anywhere in the contental US. COD
only.

(513)752-6694 After 6:30 Mon-Fri and all day on weekends.

> Sozobon expects this really arcane method of passing parameters.

It's not arcane (any more than the rest of C). Archaic, if you want to consider most C compilers available for the ST as archaic. Mark Williams, Laser C, Sozobon and Alcyon all use the traditional K&R form.

It's the way parameters were passed in C before the idea of function prototypes was endorsed by ANSI. GCC and Prospero C understand the newer format. Lattice may as well (I haven't seen it).

Sozobon follows the original Kernighan and Ritchie definition of C, with some common extensions. Some of those extensions happen to be part of the (fairly new) ANSI standard, and the library largely follows the ANSI standard, but the current Sozobon C does not pretend to be an ANSI-conformant compiler.

There was a preprocessor posted to the network (comp.os.minix) a year or so ago that purported to convert ANSI C files to K&R style. I don't know if it was ever ported to TOS. (If so, I want a copy!)

Dan Wilga of Gribnif Software recently released a K&R-to-ANSI converter called OLD2ANSI. It's on GENie.

>mentioned in the manual is missing!
>
>anyone else have problems with this software?

I also recently DLed this software, it does make incredible SPECTRUM pics from GIFs but doesn't seem to work correctly with SPC pictures. SPU pictures are fine. The standard length of an SPC picture is 51400, or at least this seems to be the case with pictures I've gotten from various locations. This program creates SPU pictures of length 51400 and for this reason I believe the author may have fouled up the sompression routines. At any rate It saves viewable pictures in SPU mode and so far as I can see runs best in Medium resolution, I base this on the fact that it fouled up an SPU in Low rez. I gather that this is a base version, the quality is far superior, but it takes about 20 mins to convert.

3125. EE Drawing programs

Newsgroup: comp.sys.atari.st
Date: 1991-04-18 05:07:45 UTC
From: whitten@kuhub.cc.ukans.edu
Message-ID: <1991Apr18.000745.29805@kuhub.cc.ukans.edu>
Source record: 233074

I'm looking for a program for drawing circuit layouts. I don't need it to actually simulate the circuits, but it would be nice to have a large assortment of EE symbols for drawing. I played around with EEDraw for the IBM, and something similar to that for the ST would be nice. Using something like Degas, and cutting the symbols as blocks and placing them is very tedious, and the screen dumps look really blocky.

Thanks for any tips,
Chris

Hi Phillip,
I have seen Nitelite's name on the ICN (Carina's own network).
If it is possible, it would be great if both some local CII and Pro SysOp's
could give you a hands on tour; who knows, ask around.
CII does support ANSI now, also SpartaDOS X. Really whatever one (Pro
or CII) comes out with first, the other adds it shortly after. CII networking
will have F-Net compatibility soon (it is in beta-testing). I have also heard
that CII/Pro network compatibility is being talked about.
CII 2.5 will be released probably this week or next week. I am not
sure what the latest version of Pro is, but I'm one of the local Pro SysOp's
can tell you.
Also MIO's can still be bought brand new from ICD, they have lowered
all the prices on thier Atari 8-Bit products. Take care, bye.....

Source record: 233076

warwick@cs.uq.oz.au (Warwick Allison) writes:

>Is there a SIMPLE terminal emulator at atari.archive?

The Okami Shell has a built-in command named `te' which will do exactly this.
However, if you have a C compiler, it's not hard to write:

```
terminal()
{
int c;
long w;
for(;;)
{
c=Bconin(1); /* read from aux */
Cconout(c); /* output read char */
if (Cconis()) /* only if key was pressed */
{
w=Cnecin(); /* read from con */
if ((w>>16)==EXIT)
break; /* terminal exit condition */
Bconout(1,(int)w);/* output to aux */
}
}
}
```

EXIT should be #defined to be the scancode of the key you want to exit the
terminal with (UNDO for instance).
I am using Gemdos for console I/O so it can be redirected.

s882854@minyos.xx.rmit.oz.au (Tehn Chin) writes:

>Have just downloaded the Okami Shell from atari.archives. I am slightly
>confused in using it as the manual is in German. I was wondering if there
>is a english version of the manual.

I'm sorry I cant write an english version of the Okami manual since I dont
have the time to do so. Future versions will come with an english intro-
duction. If anybody takes on a translation, let me know, and good luck...

If anybody has questions, please mail me. I'll be glad to help. In the first
case, the file `help' is english and contains examples for most features plus
a list of all internal commands and their flags. This should do for the start.
And, although it's german the manual contains a lot of examples, just try them
and see what they do...
If there is need I will write english documentation for new features in additionto the
german one.

+vsnyder@jato.jpl.nasa.gov (Van Snyder) writes:

+From an article in April Datamation, I see that Sparc International is only
+half-open: Their "shrink-wrap" API requires Sun-OS. The article was about
+the 88000. 88Open doesn't require a certain OS to be compliant...

SunOS can be licensed from either Sun or Interactive Systems. Wouldn't
a stringent OS compliance policy for the 88Open be better for developers
and users, in the long run?

+The article praised the 88000 and 88Open on technical grounds, but mentioned
+that Motorola's marketing was "methodical at best." It also mentioned that
+Motorola has cut the 88000 price by 2/3, and that the 88010 will be out "soon"
+Top-of-the-line 88000 is about as fast for non-floating-point as the fastest
+Sparc or MIPS, but has better support for multiprocessor architectures
+(according to Harris, who build a multiprocessor server from it)....

I won't argue about the technical superiority of the 88000, but the first ques-
tion I would have is whether Motorola would allow it to be second-sourced.
Apple and NeXT are supposedly planning systems around the 88010, but I think
they are keeping their fingers crossed too. Hopefully Motorola, MIPS and others
will provide effective competition, because we would all end up winning. Al-
though the number of applications might be about equal for the 88000 and SPARC,
Sun has reached a critical mass by selling over a million SPARC-based systems.
With the expected flood of SPARC clones, application development would become
increasingly accelerated.

#plinio@turing.seas.ucla.edu (Plinio Barbeito) writes [about PgC7600]:

#Sounds good, but does this mean that standard RAM chips will be
#incompatible with the bipolar version of the PgC? I hope this is not
#true of the other version, at least.

There probably is level translation, but don't know for sure.

>I think Atari might be in a better position to deliver and support a marketable
>product based on the PgC chips, because of their experience with the Inmos
>transputer and Helios OS, which culminated in the ATW computer.

#I'm confident of Atari's ability to create excellent hardware, and
#even software, but seeking them out for the strength of their marketing
#of the ATW sounds funny somewhere :-).

It wasn't because of their (past) marketing strength, that I thought a PgC-
based system from Atari was plausible. Their development (in conjunction
with Perihelion Hardware and Software) of the ATW, resulted in a system with

awesome capabilities. Unfortunately, it was based on chips from a manufacturer who was financially unstable and incapable of producing the chips in volume. The complexity and pricing of a transputer limited the ATW to research institutions, but the explicit design goal for the PgC 7600 was its basis in very inexpensive workstations ($500-$2000?), which coincides with Atari's arena.

There are enough similarities between the Inmos transputers w/ Helios OS and a PgC 7600 w/ Taos, so that Atari will be able to translate their experience as well as any other firm. They have marketing capabilities that are superior to Sinclair's and it will be a lot easier to sell a $1000 80 Mips PgC-based computer capable of running MS-DOS/MAC/GEM programs than a $8000 12.5 Mips transputer-based system.

#...($20 for 160MIPS still sounds a bit off the far end, though).

I have to agree, the proof is in the Cambridge pudding. As a wild guess, if it takes an average of 8-10 Pgc7600 instructions to emulate an 68000 instruction, then at 160 Mips it would be equivalent to a 20-16 Mips 68000 cpu. Since the PgC7600 is only capable of 80 Mips when coupled with cheaper 80ns DRAM, then the performance would be equivalent to a 10-8 Mips 68000 and a 20-16 Mips 8086, assuming 4-8 Pgc7600 instructions to emulate it. The prices for the equivalent systems would be in the $3000+ range.

Jack

P.S. For anyone interested in the Inmos transputers, Computer Systems Architects (CSA) is offering the Transputer Education Kit. The kit is comprised of a IBM PC add-in board with a 20 Mhz 32-bit T425 processor, two compilers (Occam and C), an assembler and 1500 pages of docs for an introductory price of $236. Options include 4MB of local DRAM, faster processors and upgraded software. Contact CSA, 950 N. University Ave, Provo, UT 84604 (801) 374-2300, FAX: (801) 374-2306.

First of all, could Capt Jeff Long (longj at cassiopeia.radc.af.mil) please either post the articles he mailed me (14, 15 and 16) or mail them to me as they are all truncated (the .sig is there, but the articles are missing stuff at the end).

Secondly. I'm going to start posting the series as of Monday. I'll do it as follows: 2 articles a day from Monday to Thursday (though I may not get any posted on Wednesdays as I'm not always in).

The Sorcerer is 'Only visiting this planet' but can be found at:

JANET: cadx862 @uk.ac.strathclyde.computer-centre-sun
rmacgreg@uk.ac.strathclyde.computer-science
INTERNET: via nsfnet-relay.ac.uk BITNET: via ukacrl UUCP: via ukc.uucp

or second star to the right and straight on 'till morning.

|> Is there something that I am missing? I try e, -e, along with the
|> / to get it to extract to folders, but still the only command that ever
|> works is -extract, nothing else seems to.

First, the zoo expert commands do not start with a '-'. So simply type 'e' instaed of '-e'.

Second, unless the folders already exist you have to say '//' instead of '/'. '//' makes zoo to create the folders.

Summary: zoo e// archive.zoo

Hi everybody out there in Netland,

I'm searching for a UUCP packet that runs on an Atari ST
either under TOS 1.0/1.4/KAOS or Minix for the ST.
Does anybody knows a place where to ftp from from, or
any other way of obtaining it, i would be happy about
an answer.

I have been eyeballing the color printer that is being sold by Tandy.
I am wondering if anyone has ever hooked one up for use on their ST and what kind of results they had. I am looking for something to do some color printing as well as doing some rough drafts of my DTP work before taking it down to the school to laser print.

If anyone has any experience with these, I would appreciate it.
Especially with postscript files.

Source record: 232981

from atari.archive.umich.edu and each time, the lharcer croaks
on the gcc-cc1.ttp files (bad checksum)

Since this has happened each time I have d/led the file, and since
files in the .lzh archive which occur before the gcc-cc1.ttp unpack
just fine, I am left to conclude that it has to be a corrupted archive.

PLEASE, I am a very experienced netter, so I KNOW the problem is NOT
the usual "stupid didn't set binary mode before he downloaded" type of error.

HAS anyone else had this problem. I need help ASAP, as I (stupidly) nuked
my original gcc-cc1.ttp file in the process of unlhark'ing!!

>and users, in the long run?

88Open requires just as stringent compliance as Sparc International. The difference is that 88Open depends on the _external_ behaviour of the OS, while Sparc International depends on the _internal_ behaviour of the OS. Even in 1972, Parnas told us this was _bad_ software engineering.

>+The article praised the 88000 and 88Open on technical grounds, but mentioned

Probably not. Motorola has good engineers. That's all.

>It wasn't because of their (past) marketing strength, that I thought a PgC-
>based system from Atari was plausible. Their development (in conjunction

>who was financially unstable and incapable of producing the chips in volume...

It's my understanding that part of Inmos' problem was in getting screwed by US DoD: They set up a factory in Colorado Springs, from which Atari hoped to get Transputers. Then US DoD wouldn't let Inmos re-export Transputers to UK!. Not wanting to keep two Transputer production lines going, Inmos shut down the Colorado Springs operation, and got hurt in the overall deal.

3142. Which terminal emulator handles BREAK function?

Newsgroup: comp.sys.atari.st
Date: 1991-04-18 18:25:11 UTC
From: glenn@ludwig.sharebase.com
Message-ID: <9104181825.AA25212@ludwig.sharebase.com>
Source record: 233098

I want to use my Atari 1040 ST TOS 1.4 to connect to a remote SUN which is set up using a terminal handler that doesn't recognize the modem's declaration of the connect speed. Hence, it is a requirement that the terminal emulator that is used be capable of sending a BREAK function in order to tell the remote SUN to switch speeds.

ALL SUGGESTIONS WELCOMED, I require MONO monitor support, I have a hard disk, I prefer a good PD emulator that already handles BREAK support for which source is available for customization in C, ASM, or FORTH.

I am a programmer, so would also welcome suggestions as to how to program such support into my own programs: I tried toggling the break bit in the UART, with a variety of timing delays to adjust the length of the BREAK signal, but none of them seemed to be very effective. I used the XBIOS i/f to the UART chip--must that be bypassed to get it right? Sample code to do this properly would be welcomed in C, ASM, or FORTH.

Thanks to all who respond. EMail preferred.

> right around the same amount here in town with Apple][x being the most
> expensive, the Atari ST being the next higher priced, and the Atari 8-bit
> being the lowest).

I know that Atari ST's can be had for very little, but a used Apple //e,
mono monitor and 20-meg HD can probably be bought for under $500, if that.
ProLine and GBBS are both excellent BBS programs for the //e. In any case,
good luck with your BBS.

Dear all (especially Stuart),
I've completed DM1 on the Atari and am
repeating it on the Amiga. This lets you hear monsters and track them
directionally whereas the Atari doesn't. Because of this I found a
room I didn't on the Atari exploration. I heard the sound of a flying
snake/wasp on level 5 but couldn't see it so I went to where it was
loudest and switched on X-ray vision and lo and behold a new room
not shown on my `mjs' map complete with snake and a chest. despite
seeing in I couldnt get in so how....??

We are on level 5 which has the `treasure store' place with four doors
in it. OK ?

Right, coming from the long corridor with four alternate water fountains
take the corridro leading to the treasure store and go up there, turn
right and then left, past another fountain, take one step further, look
left switch on x-ray vision and there we are.

No doubt I am the last person in the world to have found this room but
how do i get in ? and matched the level 4 map and I cant see a way down
from above and from below from level 6 come to that so help please.

PS practising on level 4 and casting potions even though i dont
need to had given me experts all round more or less and i havent even
started level 9. This is to get mega characters for DM2: Chaos Strikes
Back.

Best wishes,

john

Source record: 232958

Well, I took it all apart and put the .lf and .xlf file in seperate folders.
The main program runs fine, but if I try to load a .lf or .xlf file, it tells
me that the file is too small to be a life universe, or else it loads the .xlf
file but absolutely nothing changes.... any ideas?
It seems that the .xlf file have no carriage returns in them... why not?
The .lf files just looks like garbage.
I don't think this is right, but I used the same program to take the main
program apart as these files, and the main program works fine.

Thanks in advance,

>> |> let me know the name and address of the software company?
>
>Apparently, (and unfortunately), I think Regent Software went out of ST
>business. BUT, apparently, a dedicated user of their materials, has
>taken it over.

Does anybody know who this dedicated user is. Regent Base can still be found (my local dealer has a copy), but is it still being actively distributed?

I upgraded to version 1.1 a long time ago. At that time Regent Software was starting to hype up Regent Base II. RBII was supposed to add a lot of features like full SQL compatibility. I didn't order it at the time, because I didn't have a need. If it is still available, I might consider picking it up.

>The other problem was speed.

I seem to recall that one of the services offered by Regent Software was the compilation of RB applications into .prg form. This would probably help with the speed problem. Then again, I could be mistaken about the whole thing. (Maybe it was a run-only module) Anyway, maybe the new support guy has the compiler (if it exists) and can distribute it.

On a related note, has anyone tried out Timework's new Data Manager Professional? Any thoughts you'd care to share?

I offen heard from these emulators for the Atari, allowing it to run Mac software . Advertising says that it is wunderful, efficient, fast, sure...

But say, who believe advertising?

So my questions:

- Do ALL the software for Mackies function on the emulator?

- how fast is it in comparison to a Mac LC or IIsi?

- How offen do the programs cras down?

_ What kind of hardware can you use with it (Portrait Screens CD, ...)

I will compile the answer and make a posting of it

Thank you in advance

Francois

3150. Cubase vs. Omega for ST???

Newsgroup: comp.sys.atari.st
Date: 1991-04-18 22:40:06 UTC
From: glennd@athena.arc.nasa.gov
Message-ID: <1991Apr18.224006.18116@riacs.edu>
Source record: 233083
Cross-posted to: rec.music.synth,comp.sys.atari.st

I'm on the verge of getting a new sequencer for my Atari ST, and am trying to decide between Cubase and Dr. T's Omega. I know that Cubase is supposed to be the sequencer to end all sequencers, but on the other hand, I'm presently using Dr. T's X-oR (as well as their VZ-Rider), so it only makes sense to stick with Dr. T's, if I want to multitask successfully between X-oR and the sequencer, not to mention the fact that Omega is a high-end sequencer in itself (there are plenty who swear by it).

I've pretty much researched the features of each. At this point, I need to know if there are Cubase users who routinely and successfully use it with M-ROS for non-M-ROS applications (especially X-oR). Or if they're happy with the patch editing capabilities supplied with the Satellite desk accessory. Or also, for those "in the know", if there are things that Omega can do better than Cubase (for instance, the ability to display up to 3 tracks of note and controller data at once). I've heard/read that getting M-ROS to work successfully is hard, and I've had enough problems getting incompatible programs to run together that this is definitely an area of concern for me.

Thanks in advance for any replies, which can be made via personal E-mail, or as a followup to this post.

- Glenn

>this true ?

I think Cubase is still the best, 2.0 is absolutely great.
But C-Lab's Notator is quite close...

Remember, Cubase needs a lot of RAM and a harddisk is preferred!

>Is there something comparable available for the macintosh?

Sure is, but not really anything that could *clearly* beat Cubase.
And portable Mac + MIDI-software (the level you seek) may well cost
much more than Stacy + Cubase.

3155. Looking for a good spreadsheet program!

Newsgroup: comp.sys.atari.st
Date: 1991-04-19 01:14:06 UTC
From: close@lunch.wpd.sgi.com
Message-ID: <1991Apr19.011406.7050@dragon.wpd.sgi.com>
Source record: 232966

I need a good, but preferably not complicated, spreadsheet program. I currently use A-calc Prime and I'm finding it's no longer flexible enough to handle bookkeeping entries for my business and tax forms. I'd like a more powerful program, yet I'm trying to stay with something ``mousey'' and easy to use. Would LDW Power fit this description or is there something better for me out there?

Also, does anyone produce a program similar to the PC's Turbo Tax for the ST? Or any income tax software for the ST? Even pre-made spreadsheets would be nice. Suggestions anyone?

Source record: 233095

Hi Justin,
About buying an ISAC/ST video board. It is an excellent board
for Mega ST users. It offers Moniterm compatibility (both boards were designed
by the same person) and is alot more compatible with ST software in general
than the Moniterm. The ISAC has a resolution of 1024 x 768 in both color and
monochrome modes; with a palette of 4096 in color mode, and 2 colors in
"DuoChrome" mode (DuoChrome allow you to choose which two color you prefer in
the monochrome mode).
I have seen the ISAC used with several different multisync-type
monitors, they all looked great (especially the 16" NEC 4D!). If there is not
an ISAC dealer in your area, check with American MicroTech in Modesto.
Bye.....

Luis

Yes. Sozobon is K&R C, while gcc is ANSI. Get gcc (if you have the space
on your HD), as it is FAR superior, it even produces much fater code.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.tandy

No experience with a Radio Shack printer, BUT... I've got a Fijitsu DX-2100 color printer that I never use anymore since I've sold the rest of my system. I paid $500 for it about 3 years ago, And I'd like to get about $225 or so for it now. It's a real workhorse and it's Epson JC-80 compatible which makes it work with any software. I had excellent results with it on my ST. Fujitsu is a really big company. They still make a similiar model which uses the same ribbons. Most of their products are used in industry, so you don't see a lot of them anywhere else. If you're interested, let me know...

Hey, I have no experience with a Radio Schlack [sic] color printer, but I do have a Fujitsu DX-2100 Color printer that I don't use anymore. Fujitsu's are big in industry and business, and the company makes just about everything you can thing of for computers - they're here to stay... The model that I have is about 3 years old, and has been replaced with another version that uses the same ribbons, so there is no problem getting them. I have no use for the thing since I've sold my ST and have no computer. It is Epson compatible and uses a JC-80 driver so it works with just about any program. I've got some old Tom Hudson driver that will allow dumps from any screen as well. I paid about $500 for it back then, and I'd like to get about $225 for it now. It's really quite a tank of a printer, it has a really pleasing NearLetterQuality mode, and is about 210 cps in draft. Lemme know if you're interested.

3163. WordUp 3.x info

Newsgroup: comp.sys.atari.st
Date: 1991-04-19 04:40:26 UTC
From: boyd@nu.cs.fsu.edu
Message-ID: <1991Apr19.000801.7862@mailer.cc.fsu.edu>
Source record: 232951

I have been made an offer to purchase WordUp 3.0 (the most recent version, including bug fixes). Since this company went under, I would not be able to get any support if the product has any fatal bugs. My question is this: How stable is the final update from the company. The seller tells me that it is rock solid on all machines but the Mega4 (which he has). I have a Mega2. It is a shame this product will not be upgraded, it really is nice. Any experiences with any version of Wordup 3.0x would be welcome via email or post. Thanks in advance.

Source record: 232954

Hi,
I just want to tell everyone that I now have the complete
prices for the trackballs for the Atari ST.

$25 for a regular Trackball

$35 for a Trackball with a 6 foot cord
and a right button (like on the mouse)

These are genuine Atari Trak-balls that are brand new and are modified
for use with the Atari ST and Amiga computers.

Please add $5 for P&H. Leave e-mail if you are interested.

+zuschlag@diku.dk (Jesper Zuschlag Madsen) writes:
+I just have to correct you at this subject!

+The Timex computers where special versions of the sinclair ZX 81
+and ZX Spectrum. Perhaps they didn't sell very well in USA, but were
+some of the best selling micro(home) computers ever in europa (the spectrum
+and its succesor the Sam Coupe, are still selling quite well).

Thanks for the corrections! Something does not seem clear though; I can understand Sinclair naming their machines ZX 81 and Spectrum, but... Sam Coupe(?!)

+The sinclair QL (the name is NOT Quantum QL) where fare ahead from
+all other compters in it's days. Ok it was not as great succes! but there
+is still about 100.000 users around the world.

There is a Timex/Sinclair SIG forum on FREENET, so people can exchange info about their machines. A dealer called Sharp's [Box 326, Mechanicsville, VA 23111, (804) 730-9697, Fax: (804) 746-1978] sells the Sinclair QL for $99.95. The specs for it are pretty good for that price: Motorola 68008 32-bit cpu with 8-bit data bus, 2 serial ports, 2 Atari-compatible joystick ports, ROM and expansion port, RGB/composite/TV output, network i/o, micro (tape) drive connector, 640x400/480 graphics (4 colors), SuperBasic ROM. Wordprocessing, database and spreadsheet programs are included.

Some detractions of the QL are the marginal design (must be kept cool), non-standard keyboard, archaic tape drive and limited memory expansion. Support is hard to find in the U.S., and declining, so you get what you pay for it.

+Neither Clive Sinclair or Chris Shelton has anything to do with the Psion
+computers (organiser I and II, MC200/400/600). All very fine computers,
+but overpriced. On the other hand is the Cambridge Computer Z88 one of the
+best selling notebook computer ever, and is still going strong (rumors says
+that we soon will see a new version, perhaps the Z91?).

Psion developed the software included with the Sinclair QL, so I was confused about their affiliation with Sir Clive. The portable Psions do have a lot of good features:

The three models each weigh about 4.5 lbs and are the size of a 8"x11" sheet of paper. All come with a 7.68 Mhz 80C86 cpu, eight batteries, and Intel solid-state flash EPROM memory cards.

Models MC-200 and MC-400 use a proprietary multitasking graphical OS. They also have a microphone and speaker to allow voice and sound processing. The MC-400 comes with more memory as standard (256K).

The MC-600 is MS-DOS compatible and has 768K RAM and a 1MB RAM disk, Award BIOS, flash-card slots and a CGA-type display. Battery life is about 30 hours and a 3.5" 1.44MB exteral floppy drive is optional.

Prices for the MC-200/400/600 are $799, $1499 and $2499 respectively. Contact Psion Inc, 118 Echo Lake Rd, Watertown CT 06795, (203) 274-7521. In U.K. call 44 71-262-5580.

The situation for the Cambridge portable isn't too good in the US and Cambridge North America [Portland, ME] seems to be no longer in business. There is a firm called Cambridge Direct [1419 Lake Cook Rd., Deerfield, IL 60015, (312) 940-0843], where some Z88s might be found.

A recent Znet article said that the new ST Notebook was about 1 kg (~2 lbs), so it would be seem to be in a class by itself. I'm not sure if the battery weight was included, because it would be extremely difficult to pack all the features into a package of that weight. If so, then a better name for it might be ST DataBook or ST PortsGalore (James Bond's nemesis!?)

>I think Atari might be in a better position to deliver and support a marketable
>product based on the PgC chips, because of their experience with the Inmos
>transputer and Helios OS, which culminated in the ATW computer.

+I totaly disagree! With a PgC7xxx in their hands, Atari would just make some
+kind of ST compatible (with TOS and GEM- don't joke me!)...

Maybe not TOS, but TAOS? From the article on TAOS by Dick Pountain: "Taos is now committed to producing translators for the Inmos T800 transputer, Motorola 680x0, PgC7600, Intel 386/486, Acorn RISC, and Sun SPARC microprocessors. The first three of these have already been written."

Well, what you're remembering is the ST Report flap. The ST Report on-line magazine always had an advertisement for hard-drives from the editor's business. That's fine on GEnie and CI$, but isn't in line with Usenet etiquette.

Z*Net's only flaw in this regard is that sometimes they're a bit enthusiastic about reprinting verbatim press releases from software companies. These sometimes go overboard on the advertising side. But I don't think I've nuked one in ages.

All in all, Z*Net is a much better publication than ST Report anyway.

3171. Megafile 60 noisy startup/ shutdown

From: jim.devonshire@rose.uucp
Message-ID: <0ce3fc9fa1cd280eb898@rose.uucp>
Source record: 232877

I've been trying to get Autogem to operate for me.

I've run the BOOTMAKER.PRG and told it which program to load and
the screen text which appears tells me it was successful in creating
the bootable file. I then copied the AUTOBOOT.PRG into my Auto folder
and rebooted my ST (TOS Ver.1.2). The screen text which appears tells me
that AUTOGEM is auto starting my specified program and then I am promptly
returned to the GEM desktop? My program, which is in the root directory,
does not load.

I have only one other program in my auto folder (LGSELECT) which loads
before Autogem.

Anyone have any suggestions? (other than the obvious)

From: the_pawn@tahoe.unr.edu
Message-ID: <6088@tahoe.unr.edu>
Source record: 232962

I have a friend who has just upgraded to a 1040STE with four megs
and uses it almost exclusively for MIDI. He also used Revolver
1.1 by Intersect to switch between the Midi Editing Software and
the Librarian for his keyboard (while he was using a 1040 ST), but
since he's upgraded to the STE, Revolver hasn't worked. Does anyone
out there know if there's a newer version of Revolver (v 1.1) that
works with the STE? If not, is there a version of Juggler (assuming
that it generally does the same thing) that will work as well with
TOS 1.6?

I've heard somewhere that Revolver didn't work with TOS 1.4, however,
I HAVE seen revolver work with TOS 1.4...

3174. LHA211 for Atari ?

Newsgroup: comp.sys.atari.st
Date: 1991-04-19 08:33:11 UTC
From: cae@sdfvm1.vnet.ibm.com
Message-ID: <9104190833.AA10991@ucbvax.Berkeley.EDU>
Source record: 232973

(Sorry if this is a duplicate)

For about a month now LHA v.2.11 (the successor to LHarc 1.13c) is available
as both .EXE and source code for MS-DOS.
Has somebody started a port to the ST already? Since a number of assembler
modules is involved I suspect it's not straight forward.

LHA211 gives about 10% (?) better compression ratios than LHarc113, is faster
(in decompressing), upward compatible, but needs more memory.

Cornelius cae@sdfvm1.vnet.ibm.com

I hear a lot about opus, but I still can't get charts to work. Why
does one need valid printer fonts just to see charts on the screen?

It is a set of programs that lets you handle floppies formatted for MS-DOS
(or Atari) on your Unix machine.

I have it installed on my Sun IPC and use it to exchange files with my
Atari ST. The big plus is that it works much faster than transfer over the
serial line.

The sound is from autoparking the heads during shutdown and releasing
them during startup. Perfectly normal.

3 CSB questions:

1. Where is the Topaz key?

2. How do you get to the large area on level 4 marked Dain?

3. On the west side of level 3 are 3 doors one right after the other with no locks. You come to these right after you open the door with the gold key. How do you get through these?

Thanks!
Rick

Greets to all on this newsgroup.

I have been reading this for about a day to find
the answer to my question, but it just isn't here.
So, here it is...

Is there a good terminal program that supports
Xmodem and Kermit and has good VT100, VT320, or
VT420 terminal emulation? If you are aware of
such an animal please send me E-mail as I do not
read this news much at all.

Also Many of you have previously posted about
Xmodem for the Vax. If you are interested in
getting this utility send me E-mail and I will
see about getting it to you.

Thanks in advance.

Mtools does not run on an ST -- at least it has no reason to. It is a set of utilities to assist cross-developers on non-DOS/non-TOS machines. Originally, it was created to allow someone on a Sun read/write IBM floppy disks. Since TOS is compatible with the IBM format, a Unix-noid can use it to download favorite comp.binaries.atari.st stuff from the network directly to disk. Another possibility is to run the Sozobon compiler on the Unix machine, create binaries for TOS and write them to the floppy disk directly with Mtools. The process avoids Kermit and the other messy serial protocols. The code is easily ported to other hosts, as long as you have some way of reading a 512-byte sector from the raw disk. We have Emmet P. Gray to thank for this; I only use them.
Brian Cooper.

>
>Do you know where to ftp it?

I got my copy from aixpsb.rrz.uni-koeln.de (134.95.128.215), directory
/msdos/arcutils/lharc, exe as: lha211e.zip, src as: lha211sr.zip.

You can get a complete (?) list of available archives by using
archie@cs.mcgill.ca; this is an 'archive-archive' (mail based and
interactive server). Send mail with a line
prog lha2
and it sends back all findings (available anonymous ftp files) containing
this string from its database. aixpsb is listed, too.
It seems to not contain atari.archive, though.

3187. Ultima III MIDI

Newsgroup: comp.sys.atari.st
Date: 1991-04-19 15:24:30 UTC
From: borkowsky@zodiac.rutgers.edu
Message-ID: <809.280f0bae@zodiac.rutgers.edu>
Source record: 232852

(To Whom it may Concern: Sorry about my last message, but it's not MY fault...I'm netted through the crumbiest editor in existence...)

Now, about MIDI sound in Ultima III, it is only on one channel (not like King's Quest V, or so), but even that one channel is better than the squeaky sound of the monitor speaker...Plus, you can change the sound by using another preset. (Ultima VI has full MIDI support on the IBM, so it should be even easier for full MIDI on an ST...)

3188. Okami Shell - NOT with VI, NO ARGV/xARG support!

Newsgroup: comp.sys.atari.st
Date: 1991-04-19 15:32:37 UTC
From: warwick@cs.uq.oz.au
Message-ID: <916@uqcspe.cs.uq.oz.au>
Source record: 232986

```
It seems the Okami shell, while supporting:

$ ls >tmp 1. I/O redirection (create AND append modes)
$ ls | grep Z 2. Piping
$ man `which x` 3. Command substitution

Does NOT support ARGV and xARG parameters!

Please, would the Author of Okami add this,
or (better) would the Authors of Mupfel add Piping & Cmd Subst.

Warwick.

I, an American, sold my PC-Ditto II to someone in Singapore - via this
wonderful INTERNATIONAL news forum. He was the highest bidder, the shipping
was only slightly higher than it would have been within the US, and the sale
went flawlessly.

> It's not too much to ask is it ... ?

Yes.

>download it from?

You need ANIMATE4 (or 3 if you can find it). ANIMATE4 is at atari.archive;
in fact, it may still be in newitems. I think the filename may be ANIMATE,
without the '4'.

Enjoy.

>neither my friend nor I have them. (is this assumption
>correct? i.e., I can't use non-Supra utilities on a Supra
>drive? I tried HDX and no-go.)

You should be able to use any utilities, including HDX. However, you will have to tell HDX the parameters of the drive (#heads, cylinders, sectors, etc.) in order to format the drive properly. Since you've upgraded the drive by replacing the mechanism, even the Supra utilities might not work for you. They know about the mechanisms that Supra uses but not necessarily about the one you put in.

Have you tried calling Supra for a copy of the utilities? They might be willing to send them to you if you can furnish them with a serial number.

3194. Can GCC treat printer like file?

Newsgroup: comp.sys.atari.st
Date: 1991-04-19 20:08:01 UTC
From: timothyg@ncsa.uiuc.edu
Message-ID: <1991Apr19.200801.26887@ux1.cso.uiuc.edu>
Source record: 232991

Hi, here is a question for a real C guru.

Does anyone know if gcc can treat the printer like a file? That is, obtain a file descriptor for the printer (fd=fopen(stdprn,..), or something like that), and then write to it using fwrite(...,fd) or putc(fd). I am aware of the TOS print routines, but I am trying to port some MSDOS code which treats the printer like a file. The port will be easier if I cam mimic this in gcc.
